

STORAGE DEVELOPER CONFERENCE

*BY Developers FOR Developers*

# New Cloud Workloads Implications for Storage Media Futures

Swapna Yasarapu and Shashidhar Joshi

# Framing the Discussion

# Framing the Discussion for Today

- Cloud Storage Services have been growing and the trend is expected to continue
- Storage Media Technologies (SSDs and HDDs) have supported these services well, until now
- However, with the growing scale, what has worked in the past, may not be good enough for the future
- We would like to bring some critical aspects of both these storage technologies that need improvement to
  - **Continue growth within their incumbent applications**
  - **Opportunity to grow into new applications**
- Through our understanding of workloads and applications, we will map requirements for these storage technologies to be able to meet the demands of the future

# Cloud Applications and Workloads

175 ZB Storage by 2025

Security,  
Availability, and  
Durability

Raising the bar on  
performance

Multi-exabyte  
customers driving  
scale, capacity,  
cost efficiencies

Low-cost storage  
for  
customers' large  
data estates

# Azure Storage portfolio

Durable, highly available, massively scalable

## Block storage

### Services

Azure Disk Storage  
Azure Elastic SAN

### Unique capabilities

Enterprise SAN Capabilities  
Container Optimized Storage

## Object storage

### Services

Azure Blob  
Data Lake Storage  
Azure Managed Lustre

### Unique capabilities

Premium Blob  
Multi-protocol access (e.g. NFS, HDFS)

## File storage

### Services

Azure Files  
Azure NetApp Files

### Unique capabilities

Native NetApp File Storage  
Azure File Sync

## Capacity

100s of trillions of objects across  
many exabytes of data

## Throughput

>300 Tbps average  
(>100 exabytes per month)

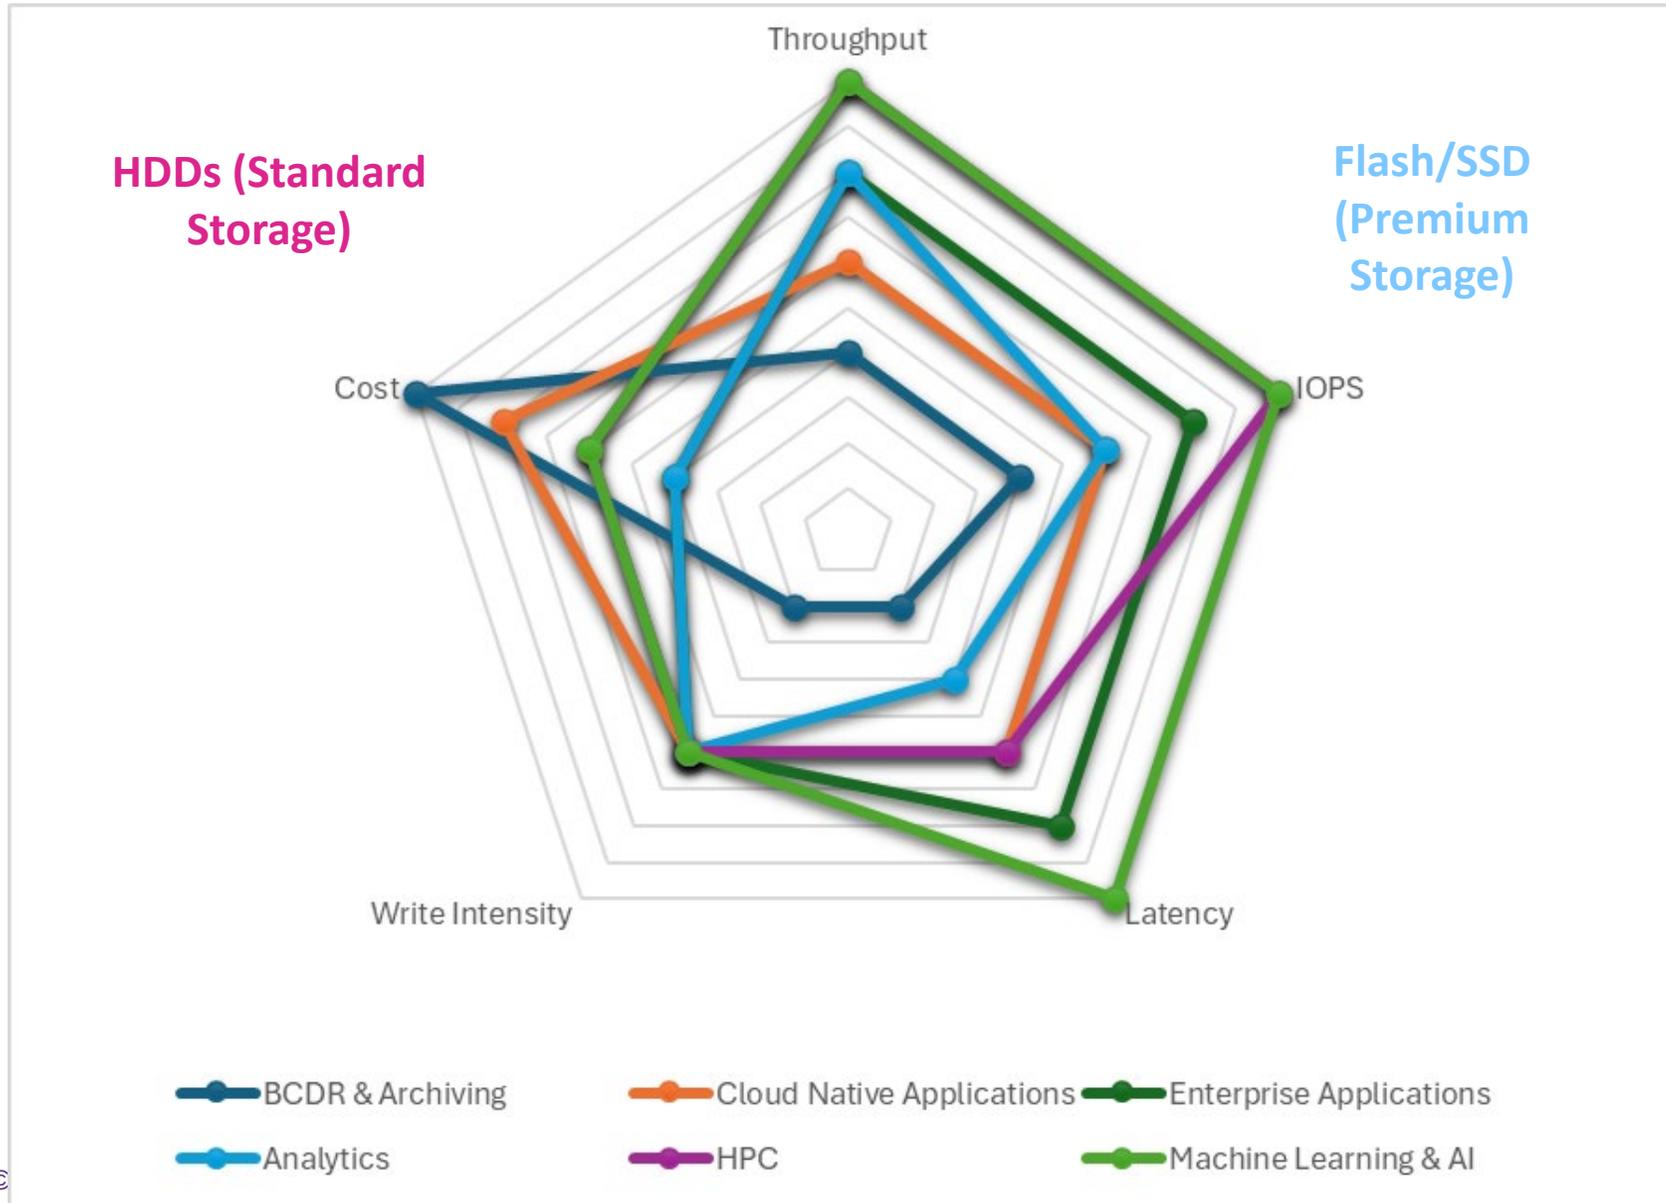

## IOPS

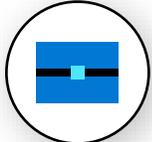

>400M tps  
(>1 quadrillion per month)

Flash/SSD (Premium Storage)

HDDs (Standard Storage)

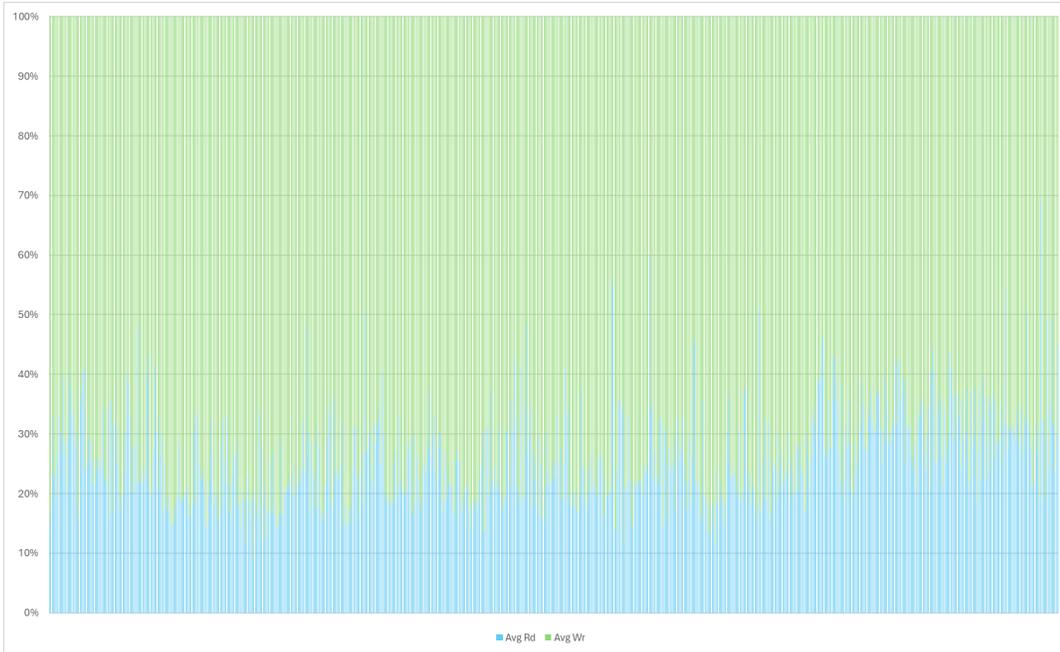

# Applications To Workloads

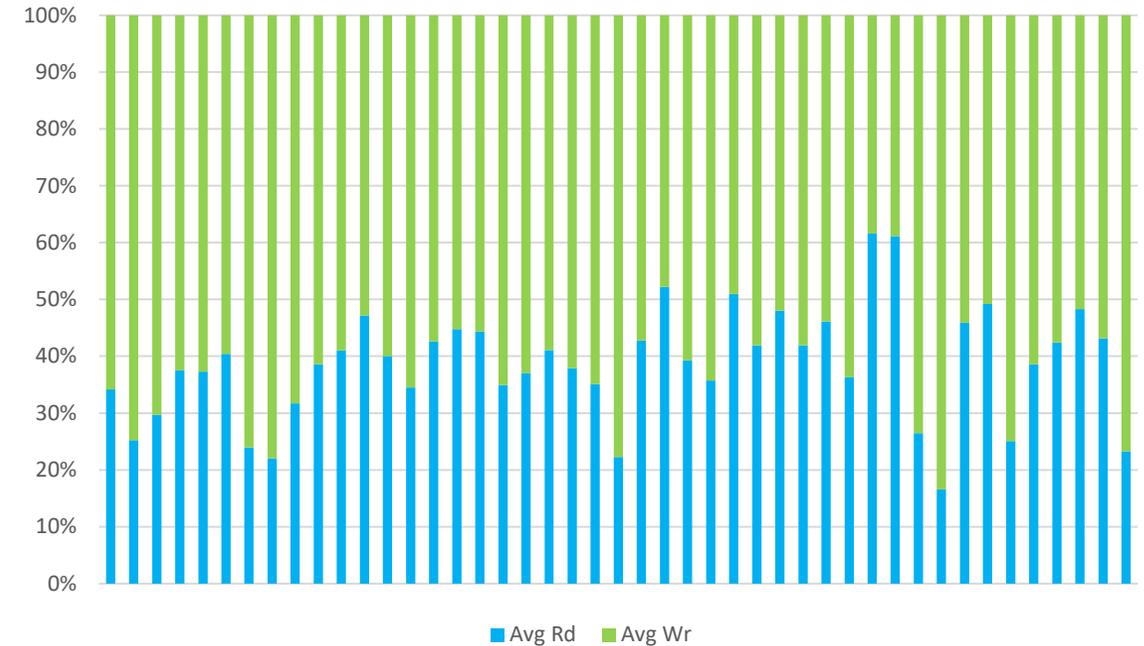

-  BCDR and Archiving
-  Cloud Native Applications
-  Enterprise Apps
-  Analytics
-  HPC
-  Machine Learning & AI

# Read- Write IOPS Mix for SSDs & HDDs

SSD Read-Write Mix

HDD Read-Write Mix

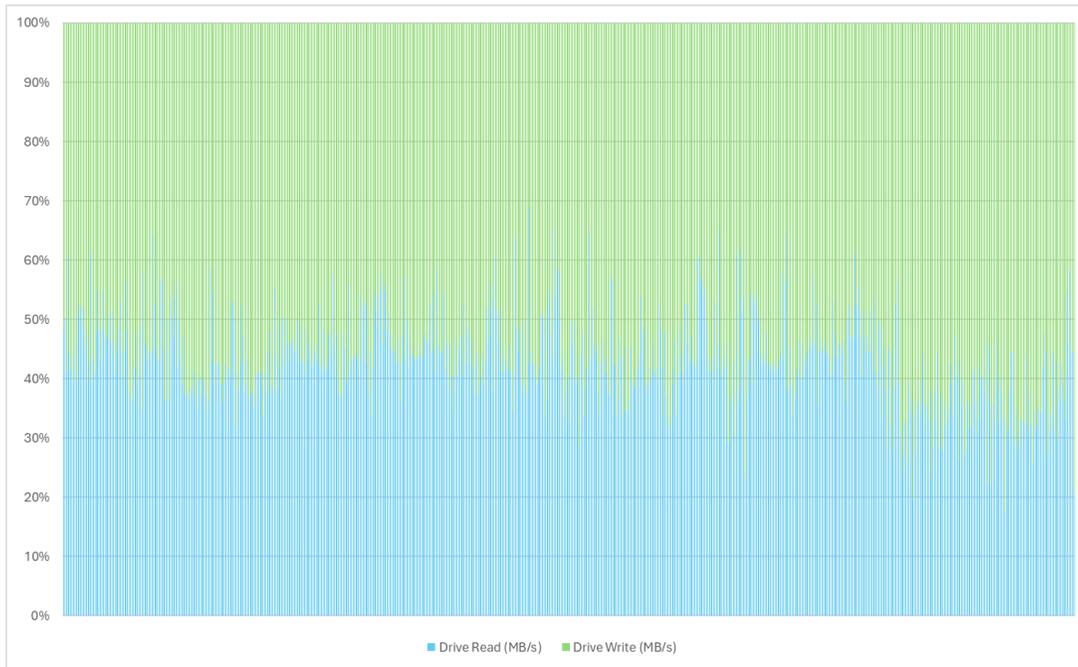

- Writes are 60% of the Workload, which includes Replication

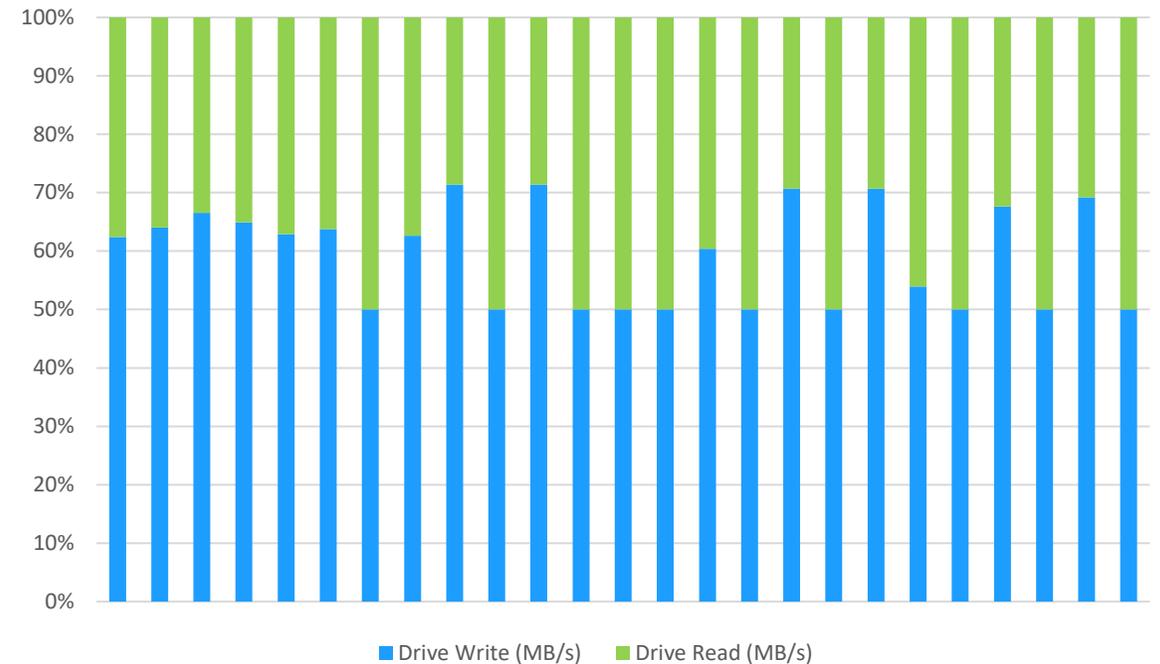

TBW Continues to be a very important metric for both storage classes

# Read- Write Throughput Mix for SSDs & HDDs

SSD Read-Write Mix

HDD Read-Write Mix

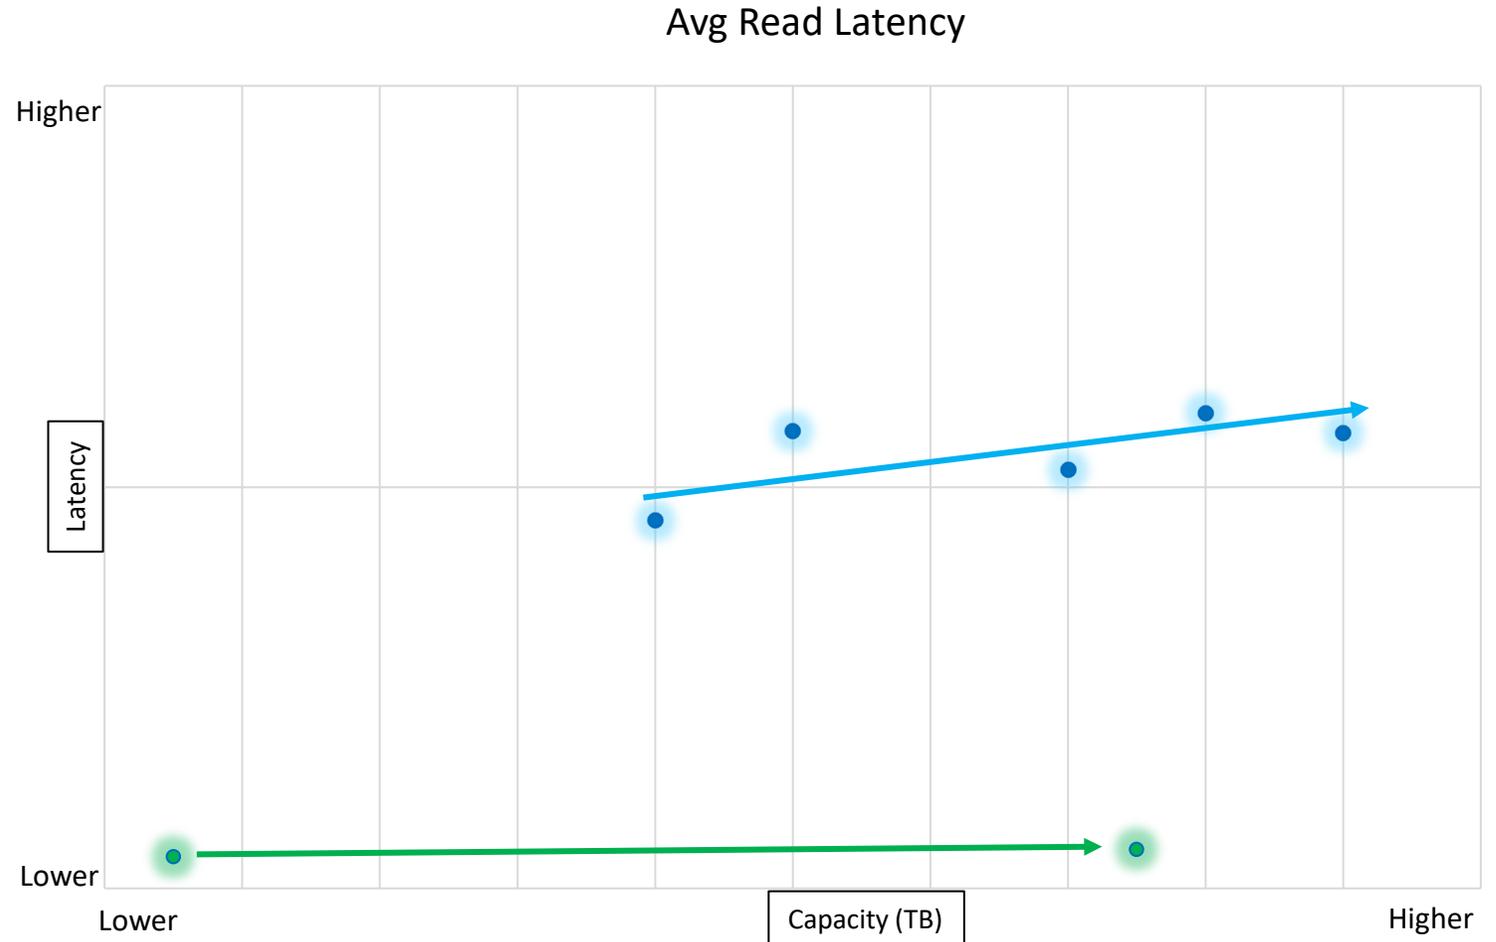

- Writes and Reads are equally important for workloads

Read-Write Mix consistent across both storage tiers; albeit at different overall performance capability

# Average Read Latency

- SSD
- HDD

- SSD Latency is multiple orders better than HDD
- SSD Latency relatively consistent across capacities
- HDD Latency is degrading as a function of higher capacity

Latency Management is crucial to meet SLAs

# Flash/SSD Implications

# What's needed from Flash/SSDs Going Forward

## Grow within incumbent applications

### Power Efficiency

- Density w/power efficiency, i.e., Lower TiB/W
- Lower Device Idle Power
- Better Power Management for in-field Power/Performance tuning

### On Par or better MBps Per TiB

- Scale throughput while maintaining latency consistency (Mixed Rd-Wr)

### Workload Shaping

- Reduce E2E WAF (E.g. ZNS) for density scaling

### Maintain PBW /TiB

- Maintain minimum endurance bar per segment

## New Opportunities

### Density

- 5-8x HDD

### Cost

- 2-3x HDD Per TB

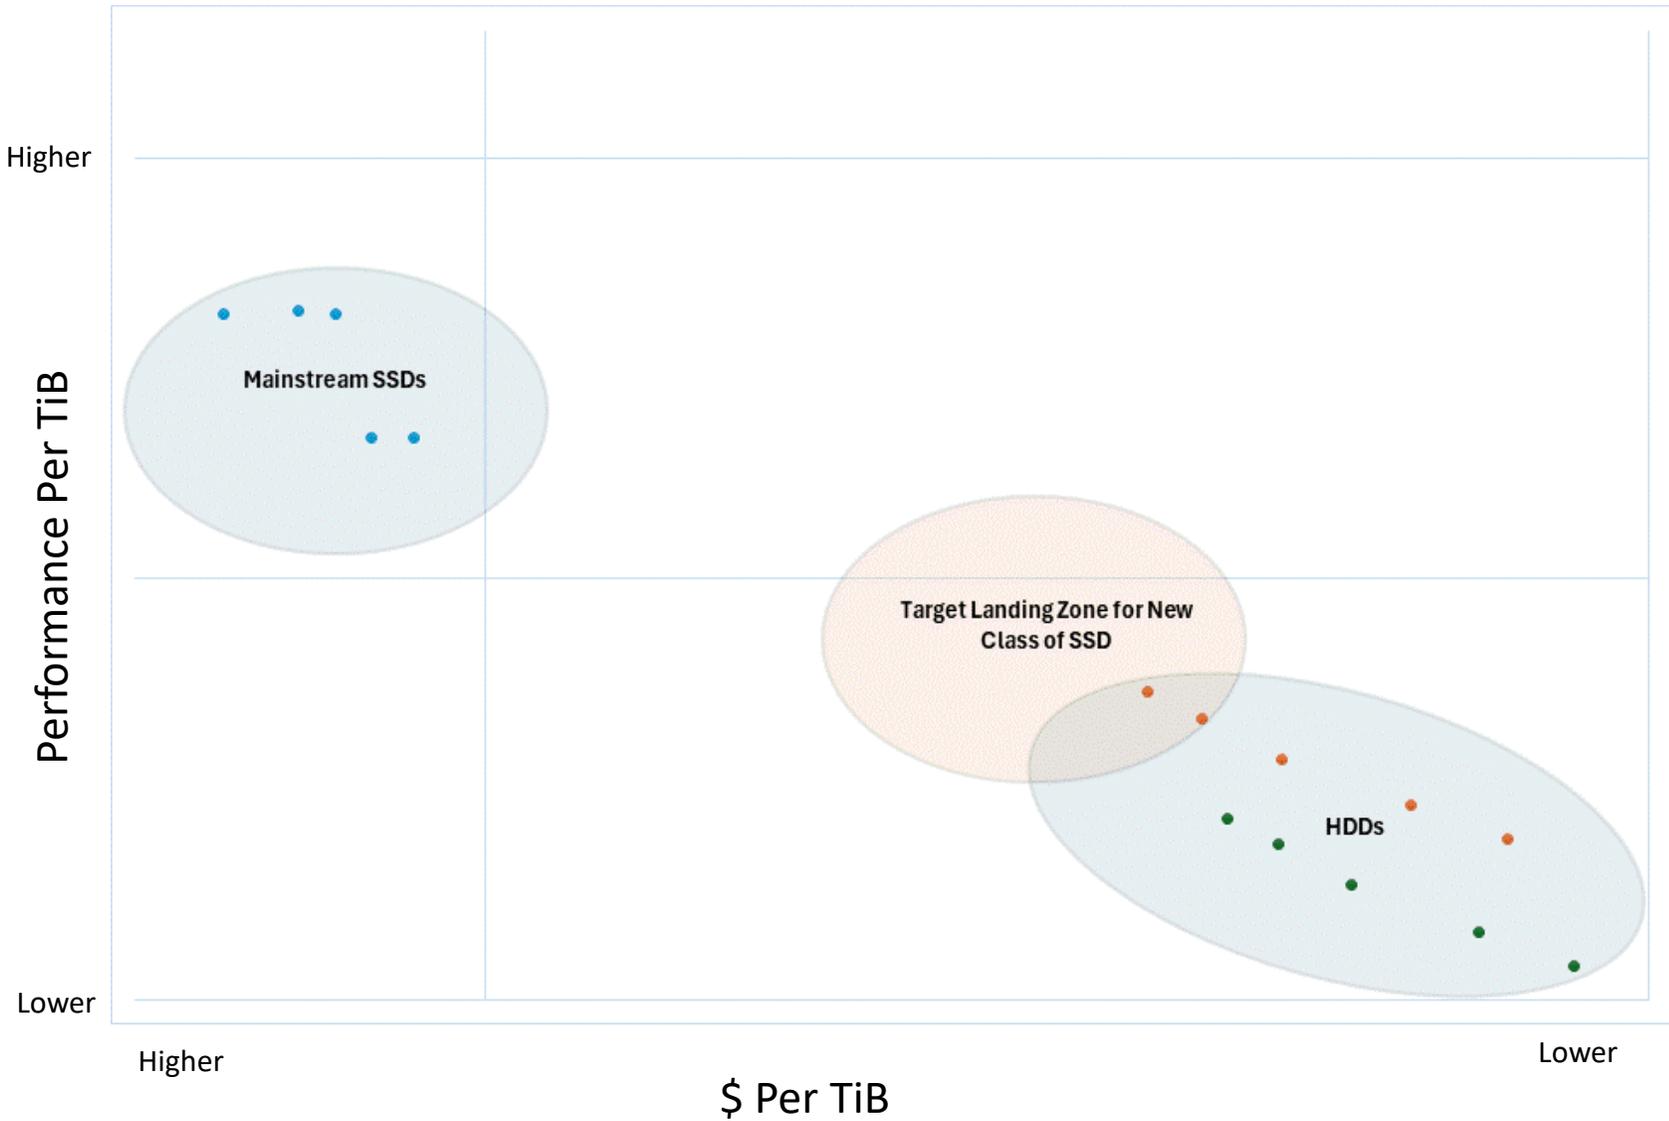

### Thruput per TB

- 2-4x of HDD

### Endurance in PBW

- Track to Writes

# Landing Zone for SSDs – New Opportunity

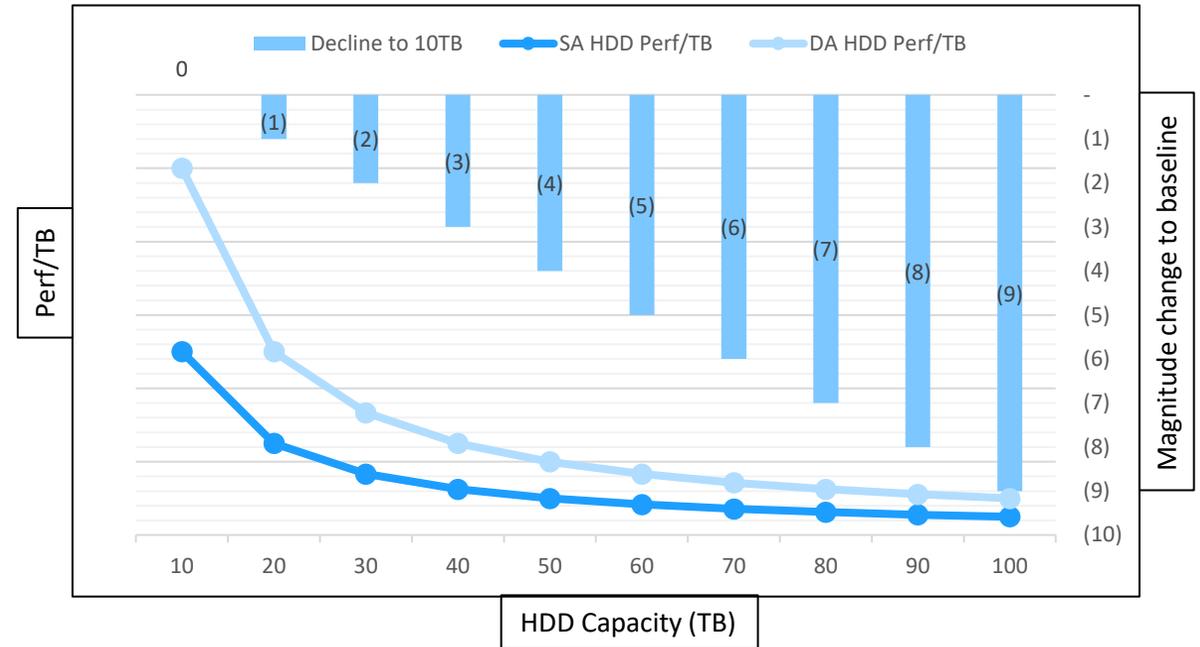

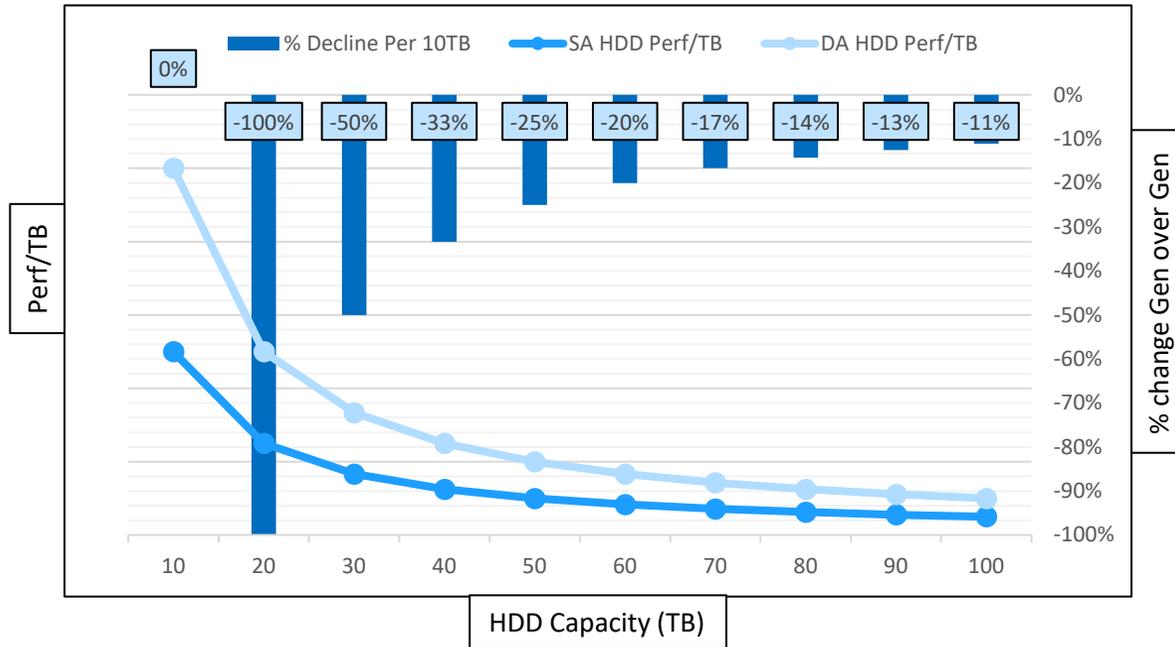

# HDD Implications on Standard Storage

# HDD Value for Standard Storage

Metric	Until Now	Projecting Forward
Capacity and Cost	<ul style="list-style-type: none"><li>• 2-4x Improvement in Capacity and Cost</li></ul>	HAMR and SMR Technologies
Performance Per TB	<ul style="list-style-type: none"><li>• Declining, but acceptable with Software Improvements</li></ul>	Decline is untenable
Workload Rating	<ul style="list-style-type: none"><li>• Stagnant but acceptable</li></ul>	Not sufficient
Power Efficiency	<ul style="list-style-type: none"><li>• Helium was the last improvement</li></ul>	Needs to Improve

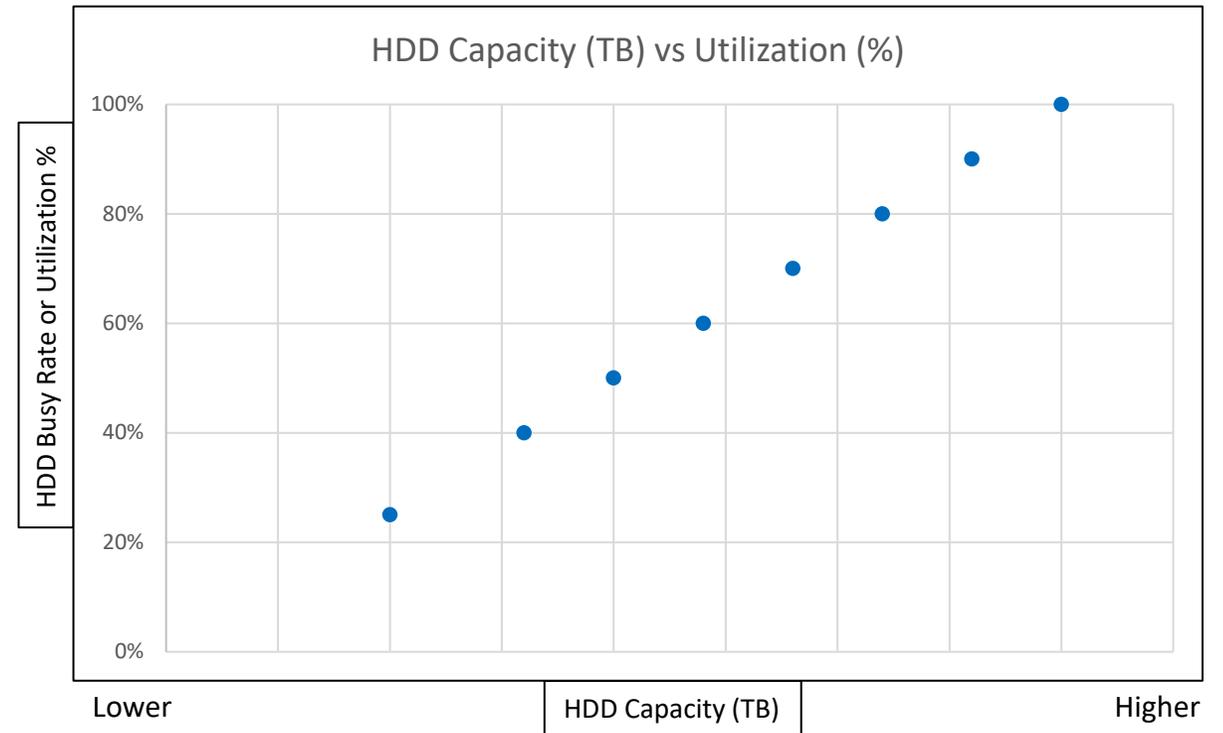

# HDD Performance Issue

- HDD Performance metrics Per TB have been degrading
- Software improvements have compensated for HDD performance degradation at the Service level
- DA HDDs certainly help, but that benefit is also over a finite range of capacities
- The Industry needs to identify additional improvements to improve IOPS/TB and/or MBps/TB metrics to be able to provide the same level of service

# Impact of HDD Performance on HDD Utilization

- 20TB HDD with host more customers with more data and get more requests compared to a 10TB HDD
- More Capacity = Busier Drive = More Utilization
- Approaching 100% busy rate = Not being able to use HDD capacity (Stranded Capacity)
- Hence the need for
  - **Better Performance**
  - **Higher Workload Rating**

# HDDs Going Forward – Deliver Better TCO

## Grow within incumbent applications

### Capacity and Cost

- Need Consistent ADC Growth
- Historic \$/TB Decline needs to Continue

### Performance and Workload Rating

- Need Performance Per TB Metrics to Improve
- Increase workload Rating

### Quality of Service

- Latency Management
- Blast Radius Management (Per Head Capacity)

### Power Efficiency

- Reduce Unit Power Consumption
- Power Management Features

## New Opportunities – Expand HDD Archive

### TCO (Capacity, Cost, Power)

- 3-4x better than Standard HDD

### Performance

- Negotiable

### Latency

- ms, but Negotiable

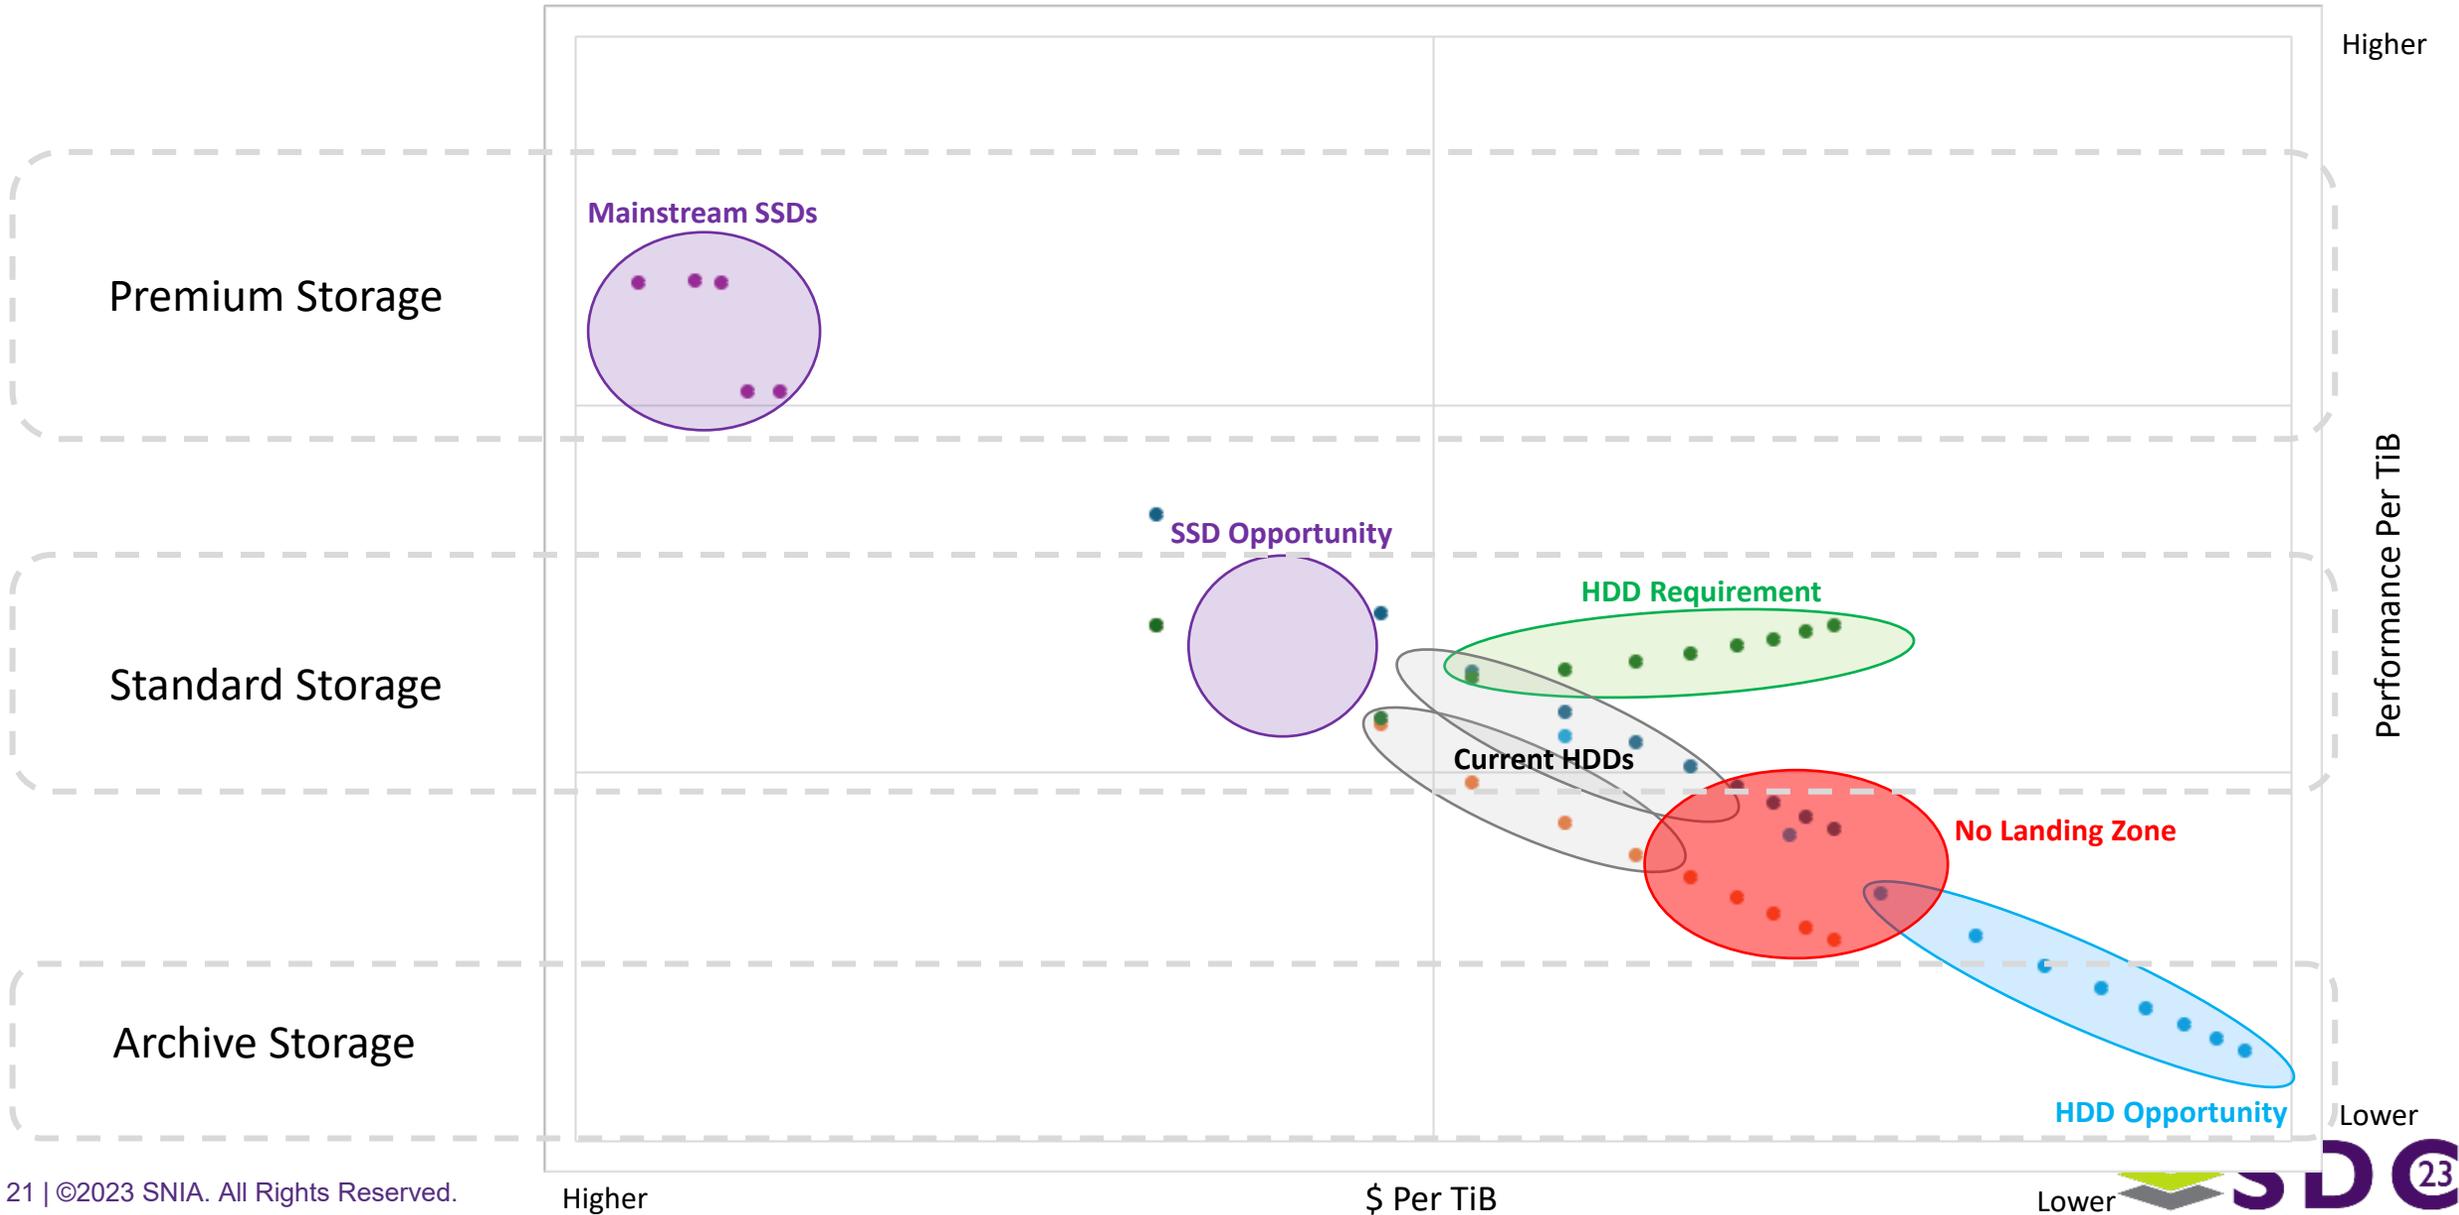

### Workload Rating

- Negotiable
