Implementing Stored-Data Encryption

Data security is top of mind for most businesses trying to respond to the constant barrage of news highlighting data theft, security breaches, and the resulting punitive costs. Combined with litigation risks, compliance issues and pending legislation, companies face a myriad of technologies and products that all claim to protect data-at-rest on storage devices. What is the right approach to encrypting stored data?

The Trusted Computing Group, with the active participation of the drive industry, has standardized on the technology for self-encrypting drives (SED): the encryption is implemented directly in the drive hardware and electronics. Mature SED products are now available from all the major drive companies, both HDD (rotating media) and SSD (solid state) and both laptops and data center. SEDs provide a low-cost, transparent, performance-optimized solution for stored-data encryption. SEDs do not protect data in transit, upstream of the storage system.

For overall data protection, a layered encryption approach is advised. Sensitive data (eg, as identified by specific regulations: HIPAA, PCI DSS) may require encryption outside and upstream from storage, such as in selected applications or associated with database manipulations.

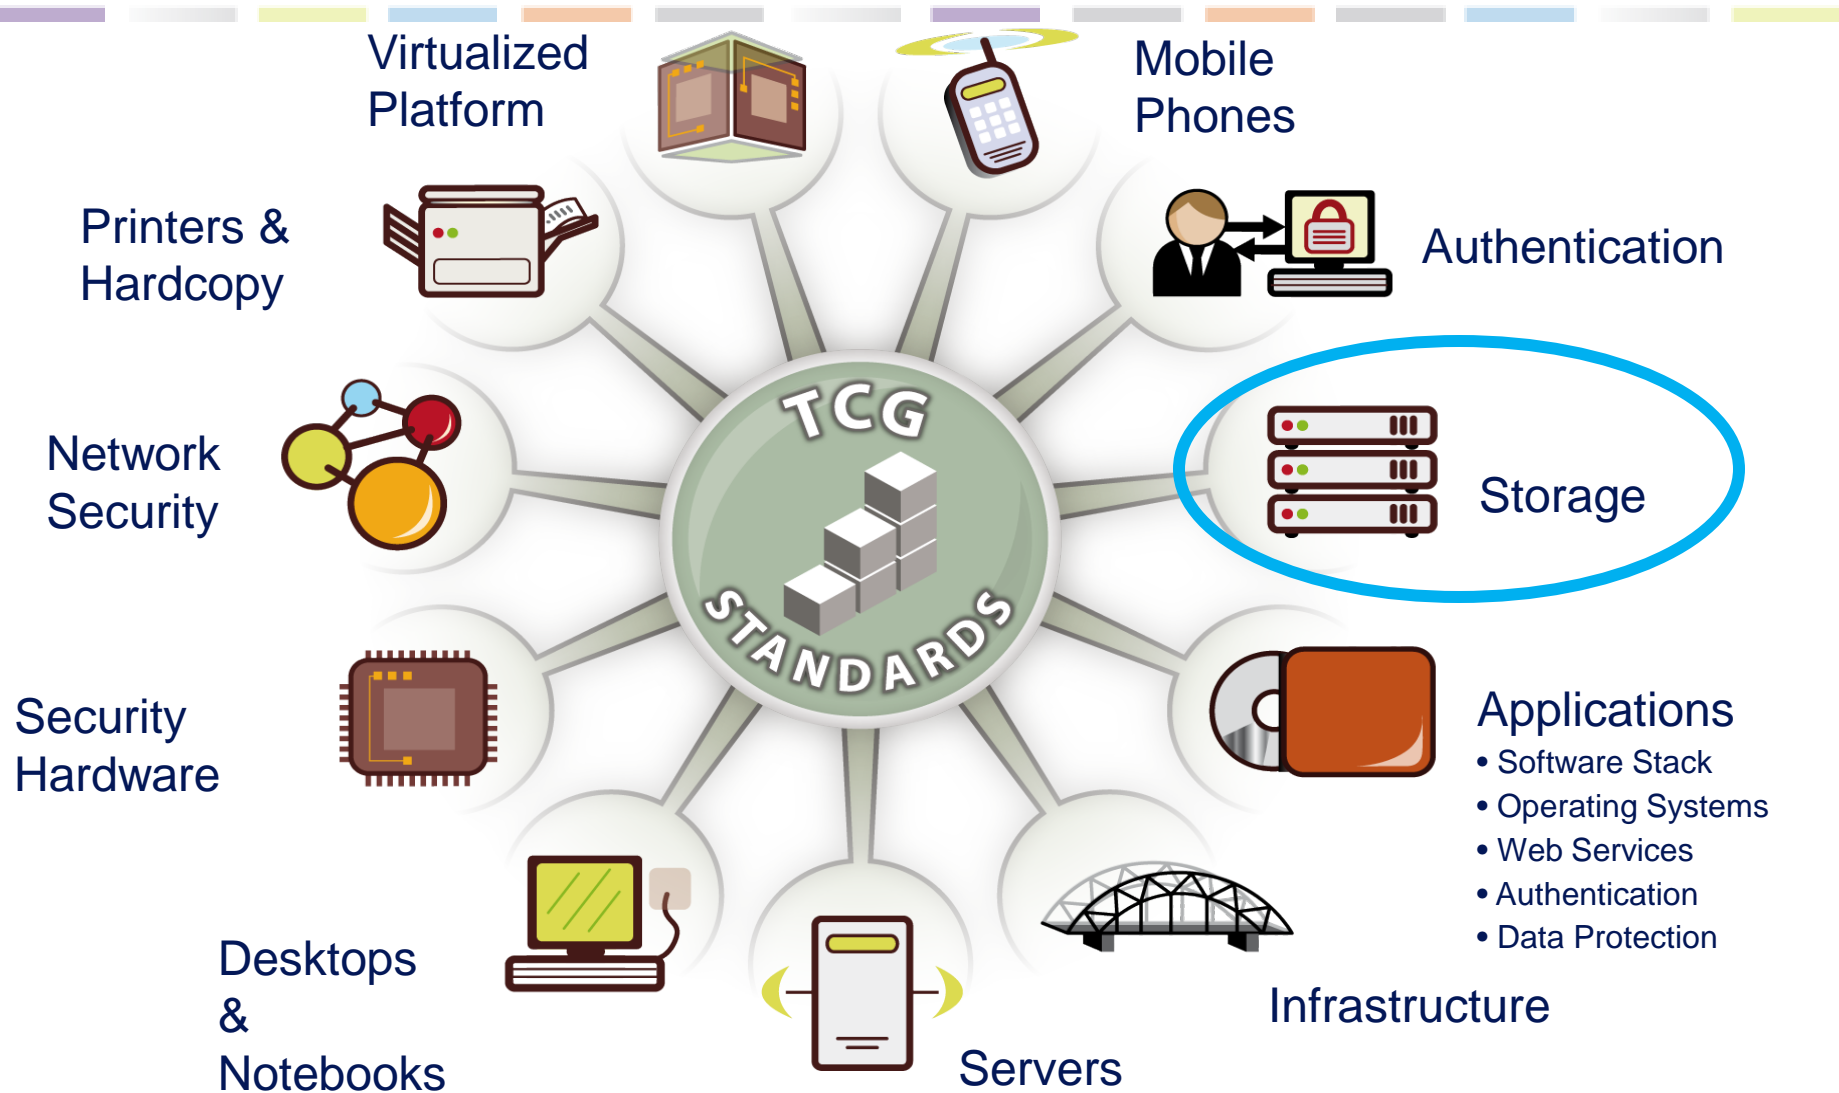

This tutorial will examine a 'pyramid' approach to encryption: selected, sensitive data encrypted at the higher logical levels, with full data encryption for all stored data provided by SEDs. The attendee should learn:

- The mechanics of SEDs, as well as application and database-level encryption

- The pros and cons of each encryption subsystem

- The overall design of a layered encryption approach

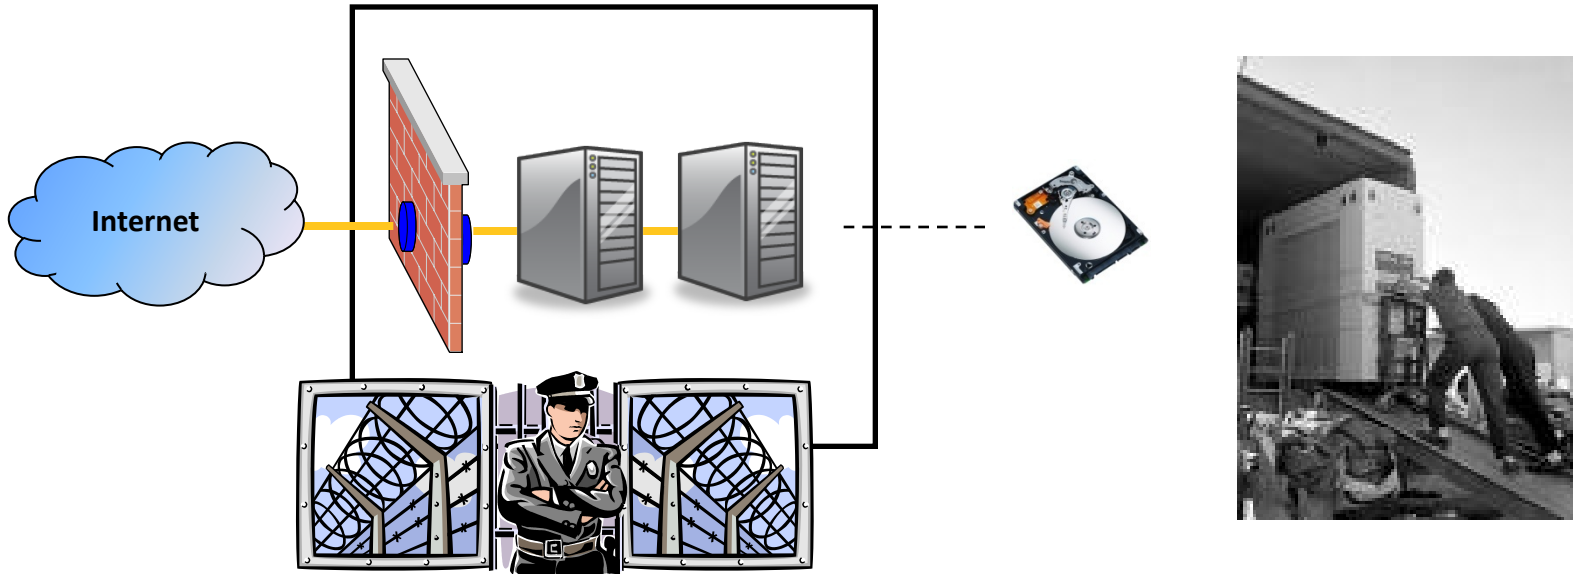

Trusted Computing Group Standards

IT Security Today

- ◆ Corporations spend millions to protect their networks, devices & data...

- ◆ Physical security, firewalls, intrusion detection, etc...

Front Door

- ◆ ...But don't always understand the risk posed by internal misplacement, re-purposing, and disposal processes.

Back Door!!

Use Case : Stored Data Protection

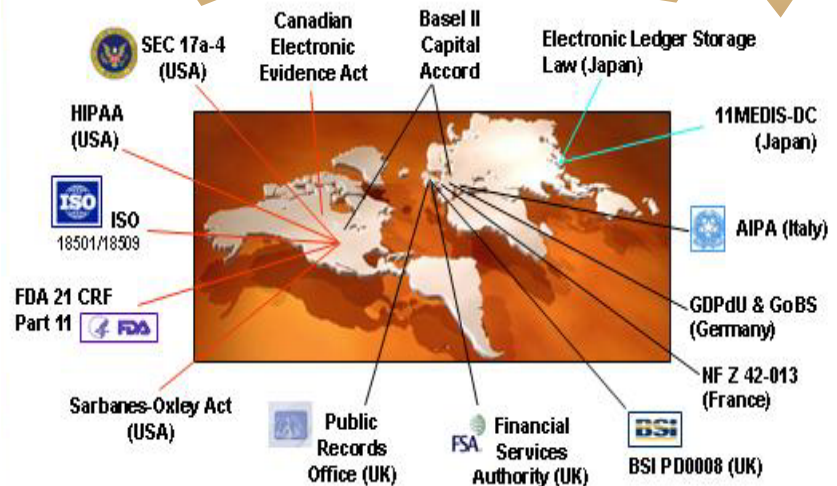

The Problem...

2005-2013: over 864,108,052 records containing sensitive personal information have been involved in security breaches

In 2013, U.S. businesses paid an average cost of \$5.4 million per data breach; that's \$188 per record

\$5.4 Million Per Incident

<http://www.privacyrights.org/ar/ChronDataBreaches.htm>

http://www.symantec.com/about/news/resources/press_kits/detail.jsp?pkid=ponemon-2013

Breach Notification Legislation

Example: California

“... any agency that owns or licenses computerized data that includes personal information shall **disclose any breach** of the security of the system following discovery or notification of the breach in the security of the data to any resident of California whose **unencrypted** personal information was, or is reasonably believed to have been, acquired by an unauthorized person...”

Encryption “safe harbor”

Why Encrypt Data-At-Rest?

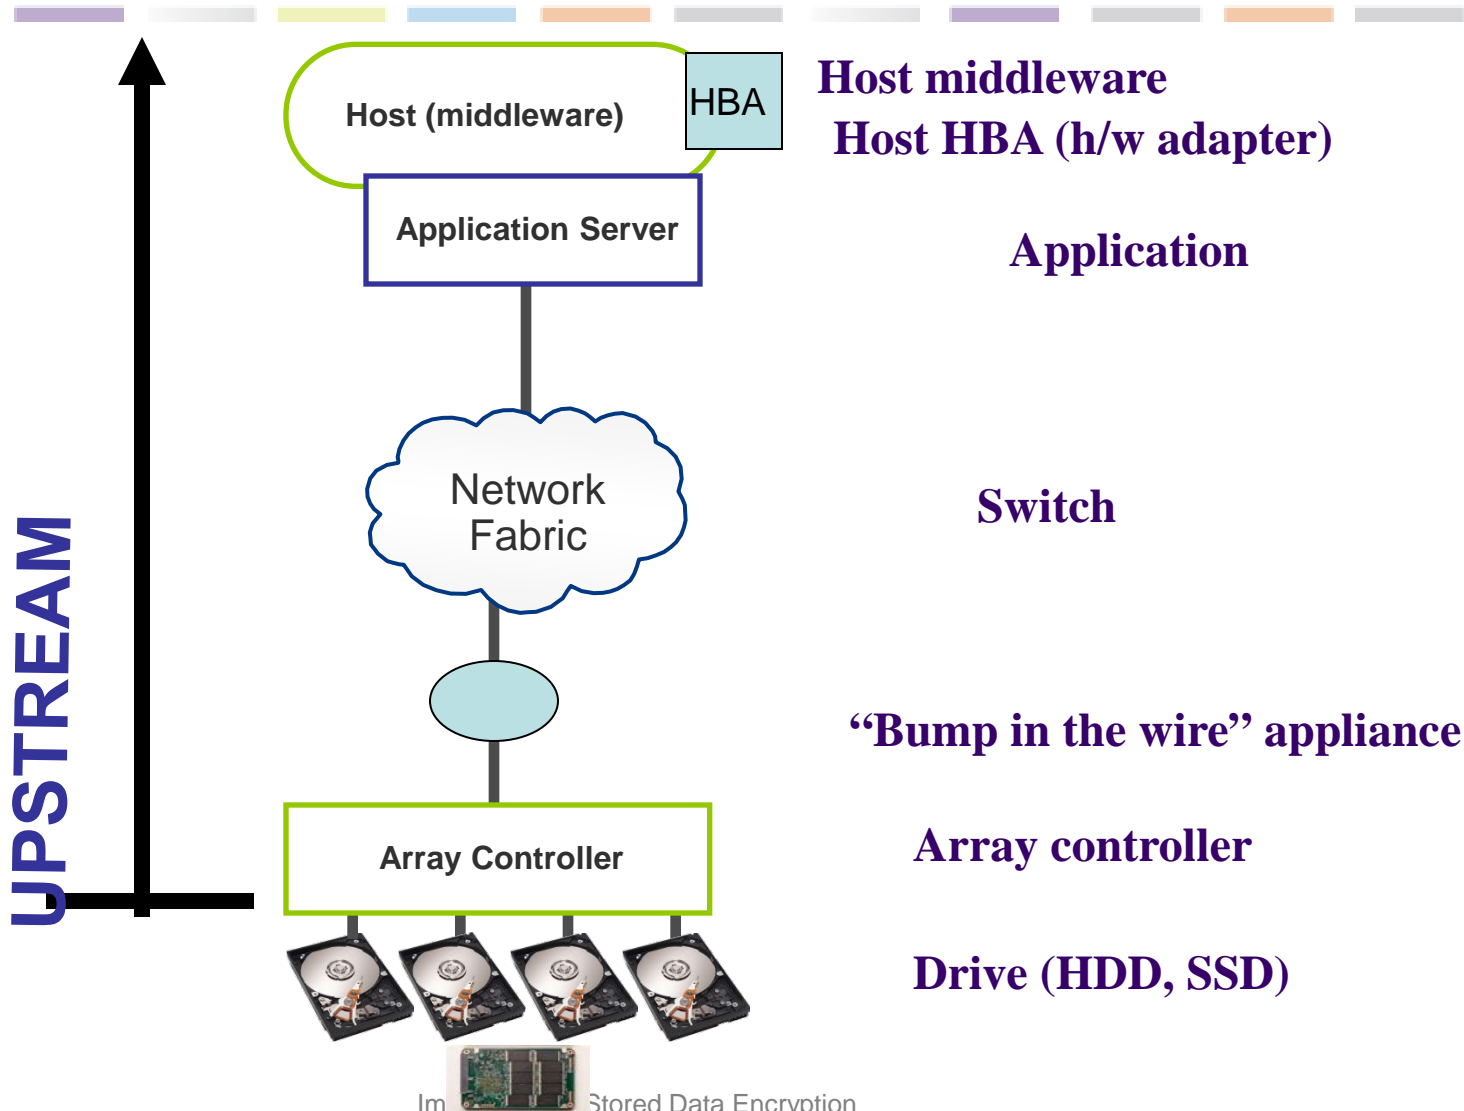

Threat scenario: stored data leaves the owner's control – lost, stolen, re-purposed, repaired, end-of-life, ...

- ◆ Compliance
 - **48+ U.S. states have data privacy laws with encryption “safe harbors”, which exempt encrypted data from breach notification¹**
- EU: Data Protection Directive 95/46/EC (27 countries) replaced with
- European Data Protection Regulation ⁴ : **requires breach notification** ³
- ◆ Exposure of data loss is expensive (\$6.65 Million on average per incident²)
- ◆ Obsolete, Failed, Stolen, Misplaced...
 - **Nearly ALL drives leave the security of the data center**
 - **The vast majority of retired drives are still readable**

Published Storage Specifications

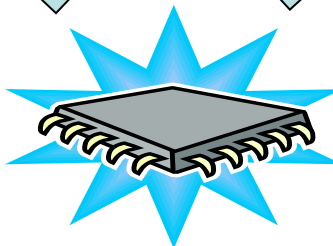

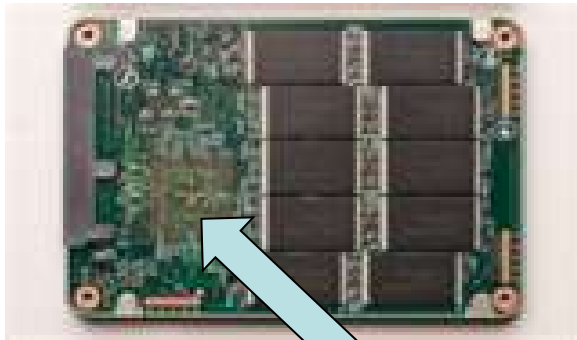

Self-Encrypting Drives (SED)

What is a Self-Encrypting Drive (SED)?

Trusted Computing Group SED Management Interface

I n t e r f a c e

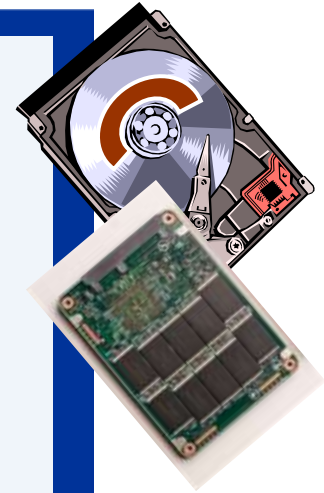

AES Hardware Circuitry

- Encrypt Everything Written
- Decrypt Everything Read

Why Put Security Directly in Drive Storage?

3 Simple reasons

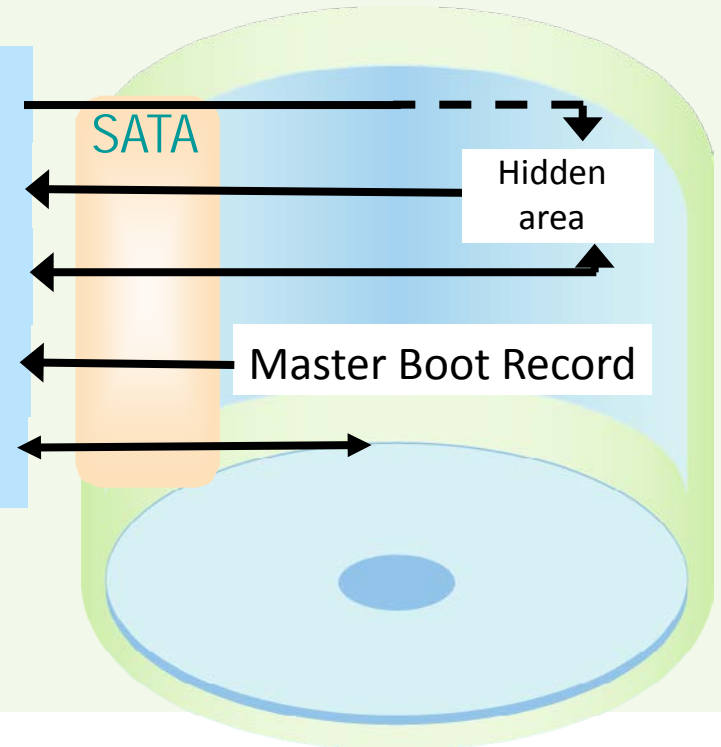

- > **Storage for secrets with strong access control**
 - Inaccessible using traditional storage access
 - Arbitrarily large memory space
 - Gated by access control
- > **Unobservable cryptographic processing of secrets**
 - Processing unit “welded” to storage unit
 - “Closed”, controlled environment
- > **Custom logic for faster, more secure operations**
 - Inexpensive implementation of modern cryptographic functions
 - Complex security operations are feasible

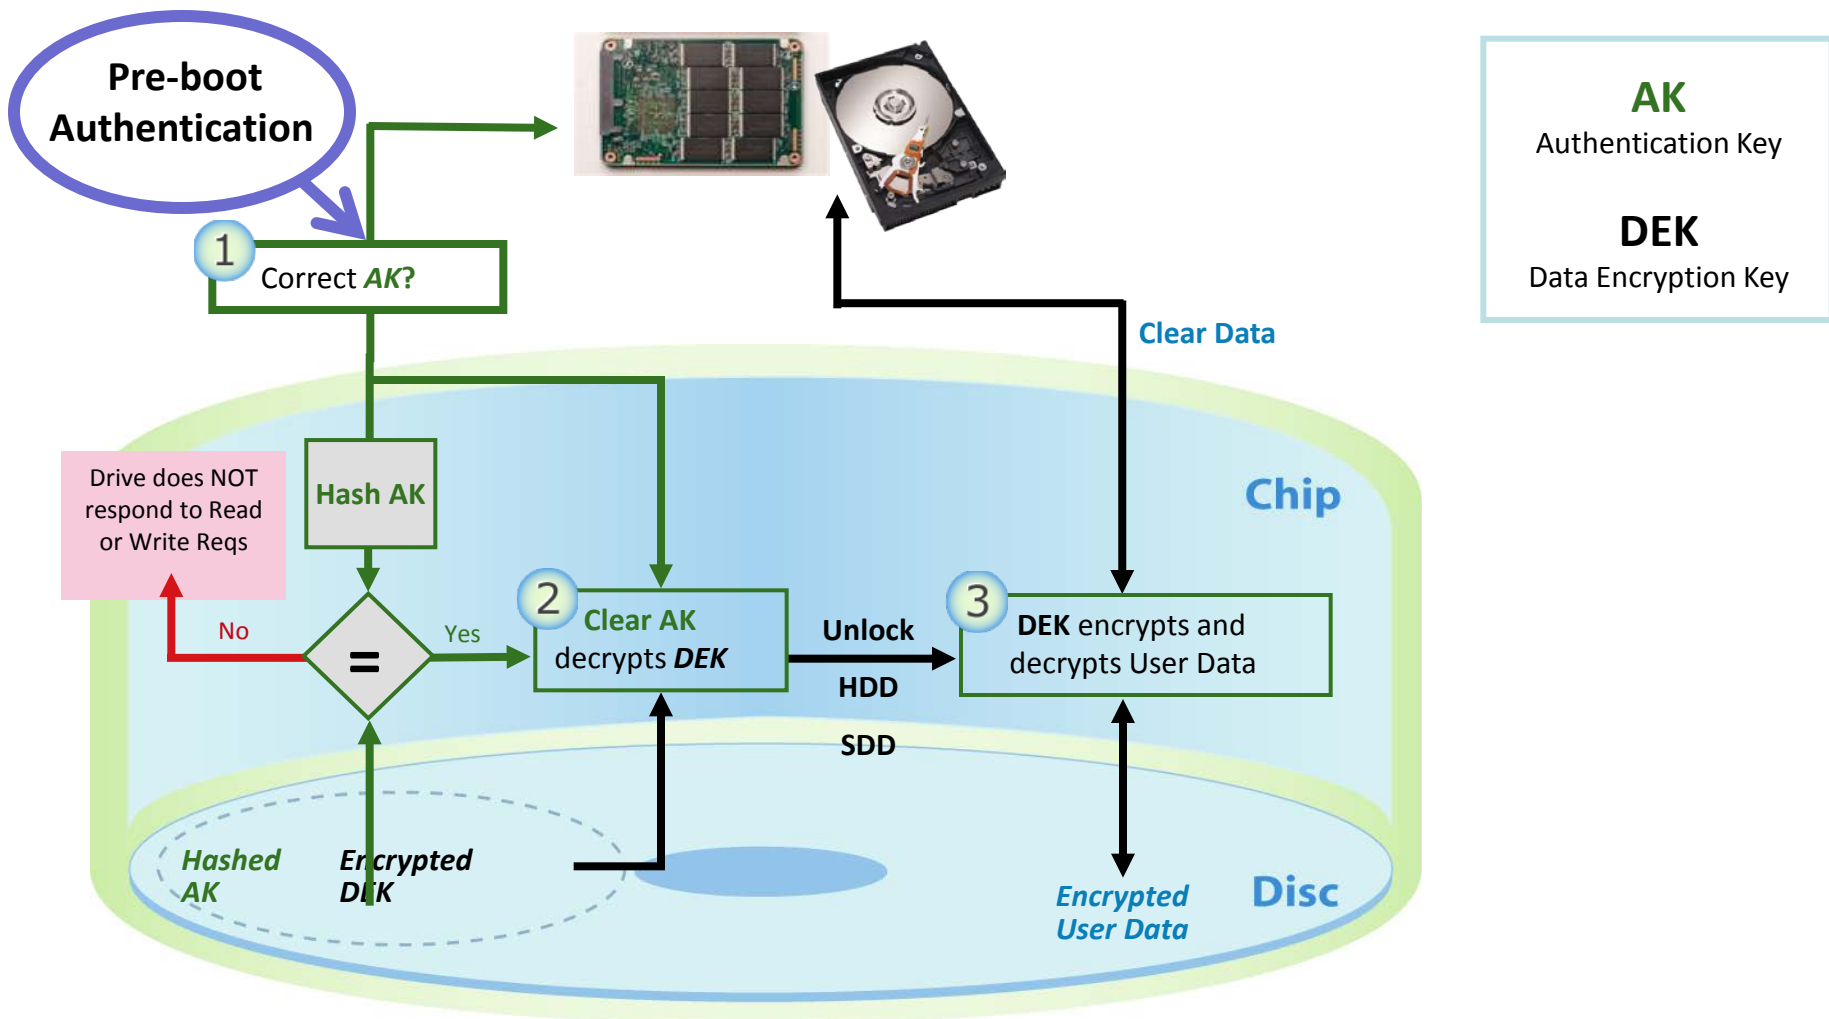

Client Security: Pre-Boot Authentication

- **Transparency: Master boot record and OS are unmodified**
- **Protected from malicious software: Authentication occurs before OS (and any malicious software) is loaded**
- **The master boot record can't be corrupted: The entire drive, including the master boot record, is encrypted**

1. BIOS attempts MBR read; drive redirects to pre-boot area
2. Drive loads pre-boot OS
3. User enters authentication credentials for drive to verify
4. If authentication successful, drive loads original MBR
5. Normal operation commences

Authentication in the Drive

Crypto Erase

► Description

- ◆ Cryptographic erase changes the drive encryption key
- ◆ Data encrypted with previous key, unintelligible when **DEcrypted** with new key

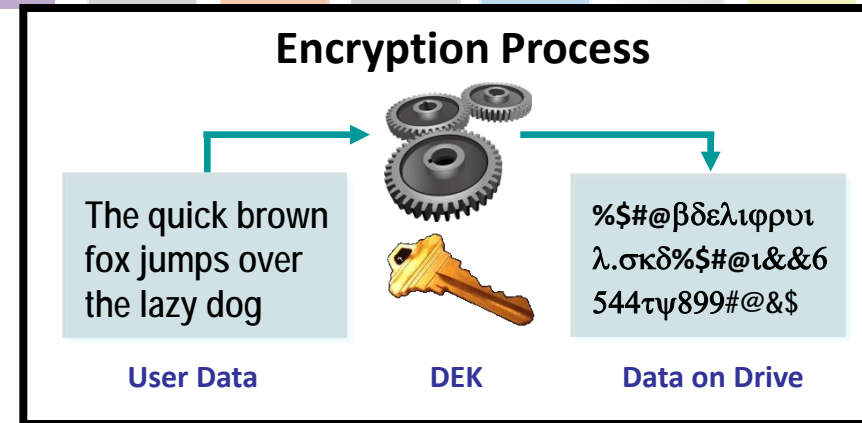

► Benefits

- › Instantaneous “rapid” erase for secure disposal or re-purposing

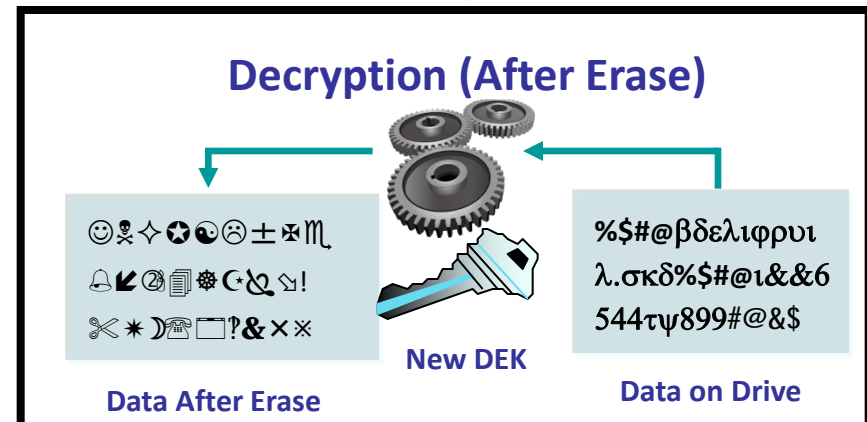

► Revision 1 of U.S. NIST SP800-88: **Guidelines for Media Sanitization** under way to support Crypto Erase

Change DEK
Command

No Performance Degradation

Scales Linearly, Automatically

All data will be encrypted, with no performance degradation

IT Retires Drives Constantly

- All Drives are Eventually Retired
 - ◆ End of Life
 - ◆ Returned for Expired Lease
 - ◆ Returned for Repair / Warranty
 - ◆ Repurposed
- 50,000 drives leave data centers daily
- Exposure of data is expensive - \$6.65 million on average
- 90% of retired drives are still readable (IBM study¹)

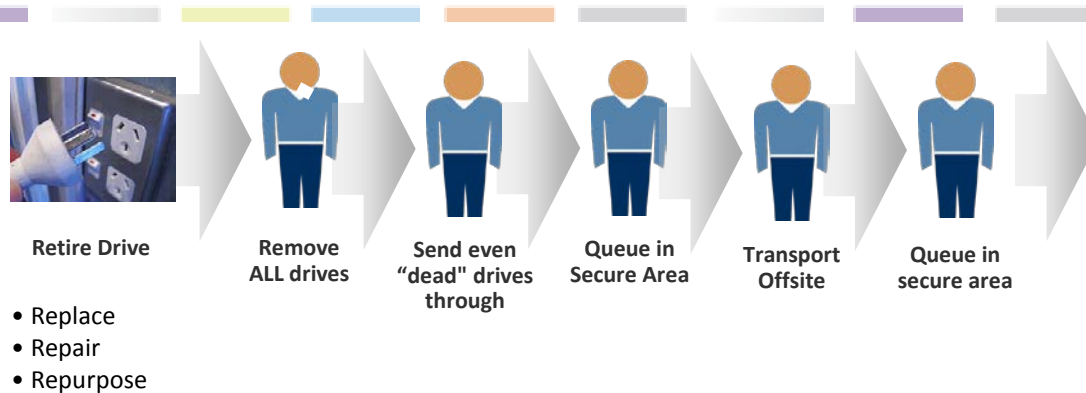

Needed: A simple, efficient, secure way to make retired drive data unreadable

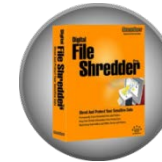

1: <http://www.redbooks.ibm.com/redpapers/pdfs/redp4529.pdf>

How the Drive Retirement Process Works

Retirement Options

Overwriting takes days and there is no notification of completion from drive

Hard to ensure degauss strength matched drive type

Shredding is environmentally hazardous

Not always as secure as shredding, but more fun

SECURE?

People make mistakes

“Because of the volume of information we handle and **the fact people are involved, we have occasionally made mistakes.**”

which lost a tape with 150,000 Social Security numbers stored at an Iron Mountain warehouse, October 2007¹

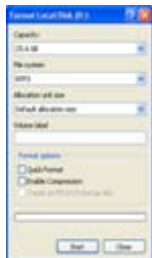

99% of Shuttle Columbia's hard drive data recovered from crash site

Data recovery specialists at Kroll Ontrack Inc. retrieved 99% of the information stored on the charred Seagate hard drive's platters over a two day period.

- May 7, 2008 (Computerworld)

1. <http://www.usatoday.com/tech/news/computersecurity/2008-01-18-penney-data-breach>

Disposal Options Are Riddled with Shortcomings

Formatting the drive or deleting the data

- *Doesn't remove the data - data is still readable*

Over-writing

- *Takes hours-to-days*
- *Error-prone; no notification from the drive of overwrite completion*

Shredding

- *Very costly; time-consuming; dependent on technicians who have other duties*
- *Environmentally hazardous*
- *Loss of investment*

Degaussing the disk drive

- *Difficult to ensure degauss strength matched type of drive*
- *Very costly; error-prone; dependent on technicians who have other duties*
- *Loss of investment*

Smashing the disk drive

- *Not always as secure as shredding, but more fun*
- *Environmentally hazardous*
- *Loss of investment*

Disposing via professional offsite services

- *Costly*
- *No guarantee of disposal*
- *Drive is exposed to the tape's falling-off-the-truck issue*

Drive Retirement: Self-Encrypting Drives

- Reduces IT operating expense
 - › Eliminates the need to overwrite or destroy drive
 - › Secures warranty and expired lease returns
 - › Enables drives to be repurposed securely
- Provides safe harbor for most data privacy laws

Key Management Simplification

Encryption key never leaves the drive. No need to track or manage ...

BUT, YOU STILL MANAGE THE AUTHENTICATION KEYS (drive locking),

to protect against loss or theft (for just crypto erase, no authentication key needed)

- **To recover data from a drive:**

- ***Only need the Authentication Key and the drive***
- Don't need to escrow the encryption key to maintain data recoverability

- Don't need to track encryption key storage separate from data storage
- Don't need to be concerned with interoperability of encryption key storage and data

Hardware-Based Self-Encryption versus Software Encryption

- **Transparency:** SEDs come from factory with encryption key already generated
- **Ease of management:** No encrypting key to manage
- **Life-cycle costs:** The cost of an SED is pro-rated into the initial drive cost; software has continuing life cycle costs
- **Disposal or re-purposing cost:** With an SED, erase on-board encryption key
- **Re-encryption:** With SED, there is no need to ever re-encrypt the data
- **Performance:** No degradation in SED performance
- **Standardization:** Whole drive industry is building to the TCG/SED Specs
- **No interference** with upstream processes

New hardware acquisition (part of normal replacement cycle)

Performance Comparisons: HDD and SSD, software versus SED

MB/Sec	HDD: no encryption	HDD: S/W encryption	HDD: SED	SSD: no encryption	SSD: S/W encryption	SSD: SED
Startup	7.90	6.97	7.99	82.50	47.90	95.33
App Loading	7.03	5.77	5.71	48.33	30.77	60.37
Modest size file test	6.13	5.00	5.28	41.13	26.77	50.40
Large Scale Data Read	84.67	52.88	82.75	178.00	70.23	169.33
Large Scale Data Write	79.60	49.50	50.31	170.80	63.60	164.50

'Hurdles' to Implementing Encryption...

Key management / data loss	<ul style="list-style-type: none">• Tracking and managing encryption keys• Tracking and managing authentication keys (passwords for unlocking drives)
Complexity	<ul style="list-style-type: none">• Data classification• Impact on OS, applications, databases• Interoperability
Performance	<ul style="list-style-type: none">• Performance degradation; scalability
Cost	<ul style="list-style-type: none">• Initial acquisition costs• Deployment costs

Addressing the Hurdles...

Simplifies key management to prevent data loss

- ✓ Encryption key does not leave the drive; it does not need to be escrowed, tracked, or managed

Simplifies Planning and Management

- ✓ Standards-based for optimal manageability and interoperability
- ✓ Transparent to application developers and database administrators. No change to OS, applications, databases
- ✓ Data classification not needed to maintain performance

Solves Performance

- ✓ No performance degradation
- ✓ Automatically scales linearly
- ✓ Can change keys without re-encrypting data

Reduces Cost

- ✓ Standards enables competition and drive cost down
- ✓ Compression and de-duplication maintained
- ✓ Simplifies decommissioning and preserves hardware value for returns, repurposing

SNIA: Encryption of Data At-Rest

Step-by-step Checklist

1. Understand Drivers
2. Classify Data Assets
3. Inventory Data Assets
4. Perform Data Flow Analysis
5. Choose Points-of-Encryption
6. Design Encryption Solution
7. Begin Data Re-Alignment
8. Implement Solution
9. Activate encryption

http://www.snia.org/forums/ssif/knowledge_center/white_papers

The Steps (using SEDs)

1. Understand Drivers: **breach laws**
- ~~2. Classify Data Assets~~
- ~~3. Inventory Data Assets~~
- ~~4. Perform Data Flow Analysis~~
5. Choose Points-of-Encryption: **drives**
6. Design Encryption Solution: **management**
- ~~7. Begin Data Re-Alignment~~
8. Implement Solution: **SED phase-in**
9. Activate encryption: **automatic**

**Greatly
Simplified
Using SEDs**

- Data classification and asset inventory not required to support SEDs
- Higher layer encryption may additionally be mandated by regulations

SED Superiority

- Simplified Management
- Robust Security
- Compliance “Safe Harbor”
- Cuts Disposal Costs
- Scalable
- Interoperable
- Integrated
- Transparent

“Many organizations are considering **drive-level security for its simplicity** in helping secure sensitive data through the hardware lifecycle from

initial setup, to upgrade transitions and disposal”

Eric Ouellet

Research Vice President

Gartner

SOLID STATE DRIVES

SSD ADVANTAGES

Reduced maintenance times and cost

Better performance

More shock resistance

More reliability (MTBF)

Less power consumption

Save \$\$ on IT cost (TCO)

+

Faster booting and application launching

+

Shock proof

+

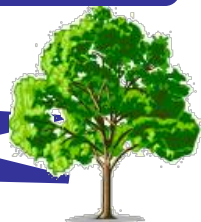

Fewer drive crashes

+

Energy efficient and **Green**

=

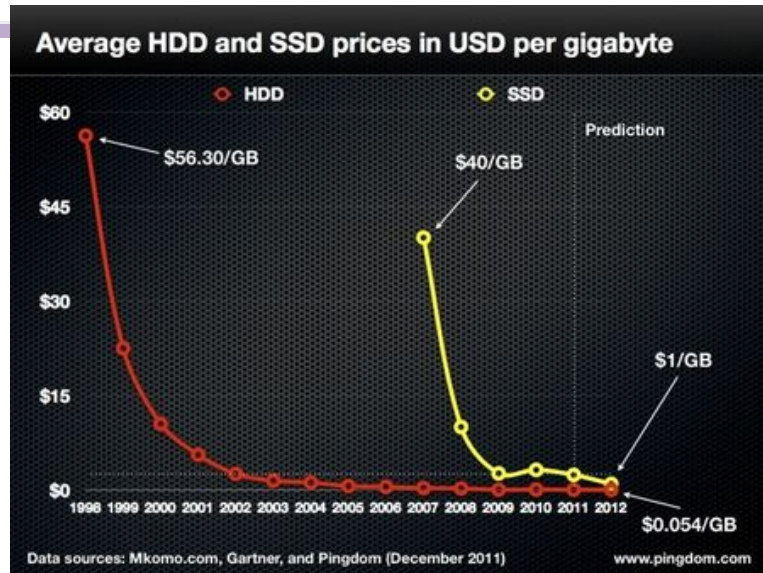

Right Solution

HDD versus SSD “Cost” Comparison

\$\$\$ / GB

\$\$\$ / IOPS

<http://www.tomshardware.com/news/ssd-hdd-solid-state-drive-hard-disk-drive-prices,14336.html>

“... heat-assisted magnetic recording (HAMR) could push the (difference) even further...”

http://www.diffen.com/difference/HDD_vs_SSD

Whereas hard drives are around \$0.08 per gigabyte for 3.5", or \$0.20 for 2.5", a typical flash SSD is about \$0.80 per GB. This is down from about \$2 per GB in early 2012.

Implementing Stored Data Encryption

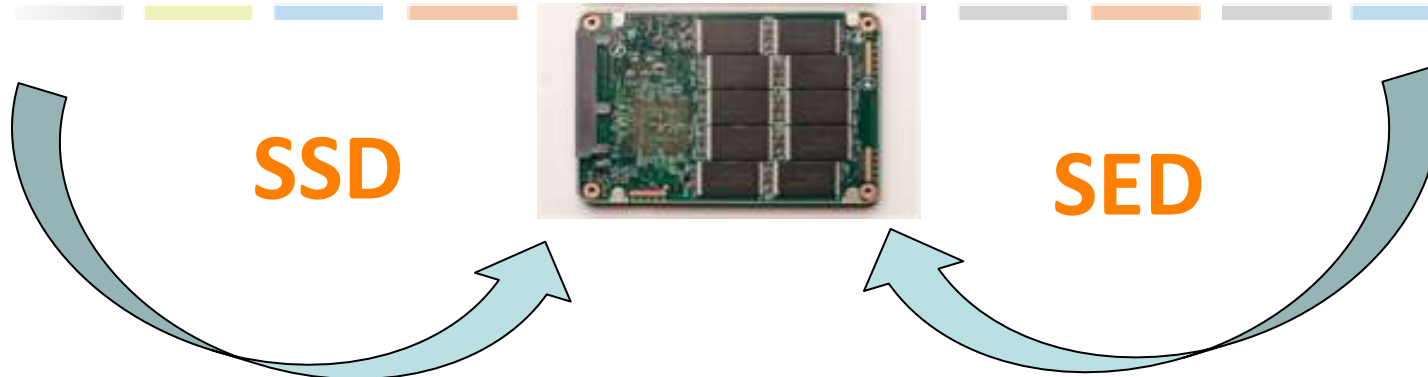

Approved SNIA Tutorial © 2016 Storage Networking Industry Association. All Rights Reserved.

IOPS are critical to the Enterprise

	Hard Drive (HDD) 1x 15,000RPM 300GB SAS	Solid State (SSD) 300GB
In/Out Operations per Second (IOPS – Higher is Better)	200~450 IOPS	10,000~25,000 IOPS
Sequential Read/Write Speeds (MB/s – Higher is Better)	Read: 240MB/s Write: 210MB/s	Read: 510MB/s Write: 310MB/s
Random Read/Write Speeds (MB/s – Higher is Better)	Read: 2MB/s Write: 5MB/s	Read: 60MB/s Write: 210MB/s
Sound	Low Hum, “clicky” sounds during Read and Write	Sound of Silence
Heat Output	Moderate	Very Low
Power Consumption (Idle/Load)	14~17 Watts	0.5~5 Watts
Sensitivity to Shock/Vibration	Yes w/ Data Loss	None
Sensitivity to Magnets	Yes w/ Data Loss	None
Fragmentation	Yes, degraded performance	None
Estimated Lifespan	1.5 Million Hours	2.0 Million Hours

<http://nutypesystems.com/rd-lab/ssd-vs-hdd-high-level/>

Solid-State Drive + Self-Encrypting Drive

SIMPLE SOLUTION

- Reduced TCO
- Increased productivity
- Better Performance
- More shock resistance
- Better reliability
- Less power use
- Approaching price parity re: HDD
- Superior IOPS

- Simplified Management
- Robust Security
- Compliance “Safe Harbor”
- Cut Disposal Costs
- Scalable
- Interoperable
- Integrated
- Transparent

Solid Security: The Rise of Self-Encrypting Solid State Drives

Thomas Coughlin

Marketing Chair, SNIA Solid State Storage Initiative

President, Coughlin Associates

2011

Self-Encrypting Drive Marketing and Technology Report

Thomas Coughlin and Walt Hubis

2015

<http://www.tomcoughlin.com/techpapers.htm>

SEDs are *already* ubiquitous worldwide

~100% of all new, office and enterprise quality, Solid State Drives (SSDs) are TCG Opal SEDs

Due to the Data Sanitization Problem for Flash (Traditional erasure techniques fail)

~100% of all Enterprise Storage (SSD, HDD, etc) are TCG Enterprise SEDs

eg, All of Google's Storage of your data and data they have on you

Fast, safe, and effective cryptographic repurposing and disposal of storage devices; protect against data leakage

100% of all Apple iOS devices are hardware SEDs for user data

when iPhone or iPad password is set, that is the KEK (Key Encrypting Key)

~100% Western Digital USB Hard Disk Drives (HDDs) are SEDs

In case you lose your USB storage device

~100% of ALL Office-Class Printers and Copiers in the world use SEDs

To protect against theft of what people have printed/copied

>>> Much smaller number of Personal HDDs are TCG Opal or SED

But Microsoft Bitlocker supports "eDrive" which requires Opal 2.0 SEDs

100% TCG Opal Drives also support the SATA Security Password (Hard Disk Password)

No Software needed: already supported by BIOS/UEFI setup on nearly every laptop and PC in the world

Note: Newest fastest solid state drives, such as NVMe, are already commercially available as TCG SEDs.
Standardization details are currently being handled by the TCG Storage Workgroup.

Factors Influencing Accelerated SED Adoption

AES/TCG in Controllers

Saint Barnabas Health Care System: Case Study

• Organization

- New Jersey's largest integrated healthcare system
 - ◆ 25 functional facilities total
- Provides treatment for >2M patients/year
- 18,200 employees, 4,600 doctors

• Environment

- 2380 laptops
- Adopted SED as standard for desktops this year (2011),
 - ◆ used by healthcare professionals and executives
 - ◆ distributed across 25 functional facilities
- Protecting PII/PHI/diagnostic information
- HP shop using Wave-managed Hitachi SEDs

Case Study

- **Barnabas Health:**

- New Jersey's largest integrated health delivery system
- Implemented SEDs in 2380 laptops used by doctors, nurses, administrators and executives across 25 facilities
- Will be encrypting 13,000 desktops used in the hospitals, via the asset lifecycle process in 4 years, 400 units expected to be done this year.

- **Key Findings:**

- 24 hours faster deployment on average per user over previous software-based encryption
- Negligible boot time versus up to 30 minutes to boot a PC with software encryption

Business Case

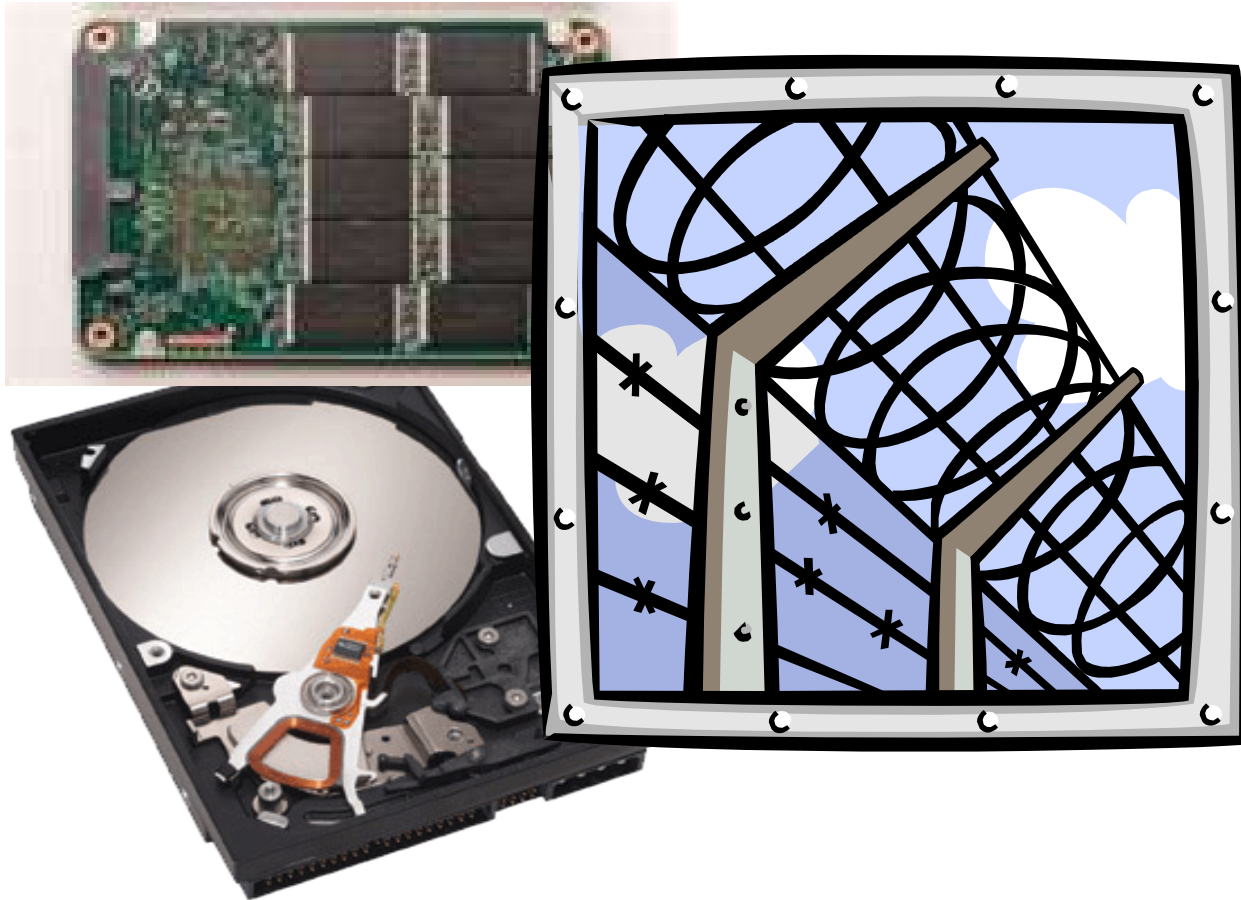

- **Identify the data protection risks/requirements**
 - Regulatory requirement for data protection
 - Safe harbor exemption
 - Intellectual property/ Proprietary information protection
- **Build a business case**
 - Market place analysis
 - Embed into the asset lifecycle program to manage expense
