Security Directions and Trends

Eric Hibbard, CISSP, CISA
CTO Security & Privacy
Hitachi Data Systems

Securing the Critical Infrastructure and Social Infrastructure of Tomorrow

❑ CEPS Task Force Report, *Protecting Critical Infrastructure in the EU*

- ❑ "...several governments around the world have concluded that infrastructures that are considered to be 'critical' are increasingly vulnerable and interdependent with other critical infrastructures."
- ❑ "...the continuity of government, for business operations and for the supply of basic services to citizens has become so high that a disruption of any of these fundamental assets can cause considerable damage."

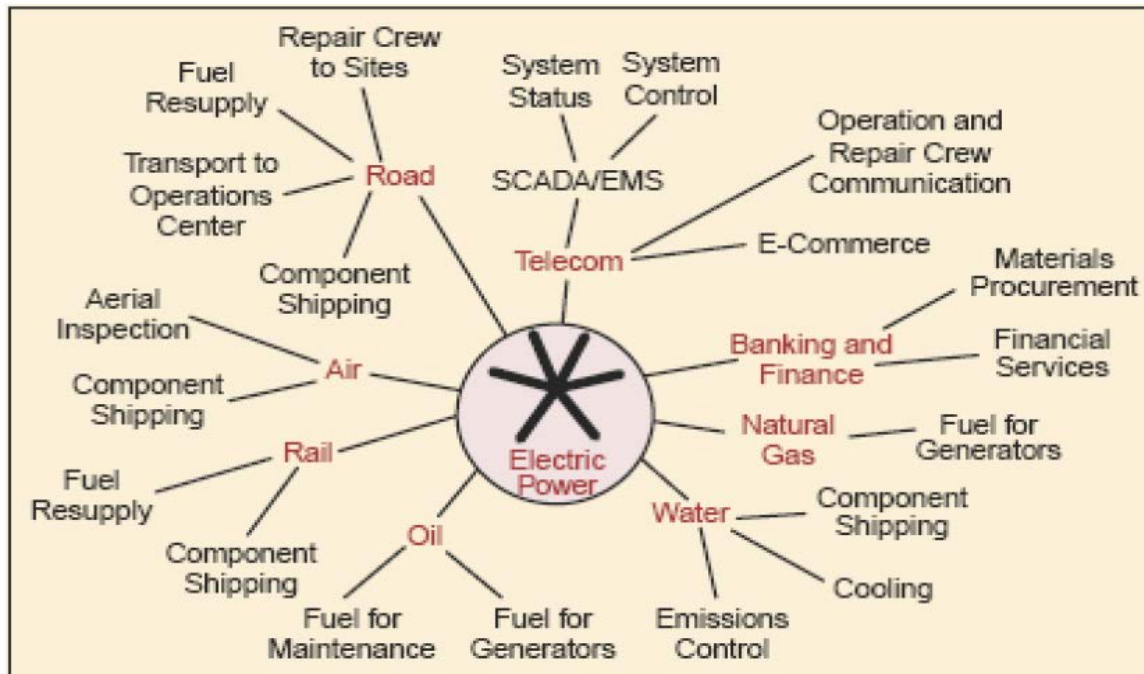

Critical Infrastructure Sectors

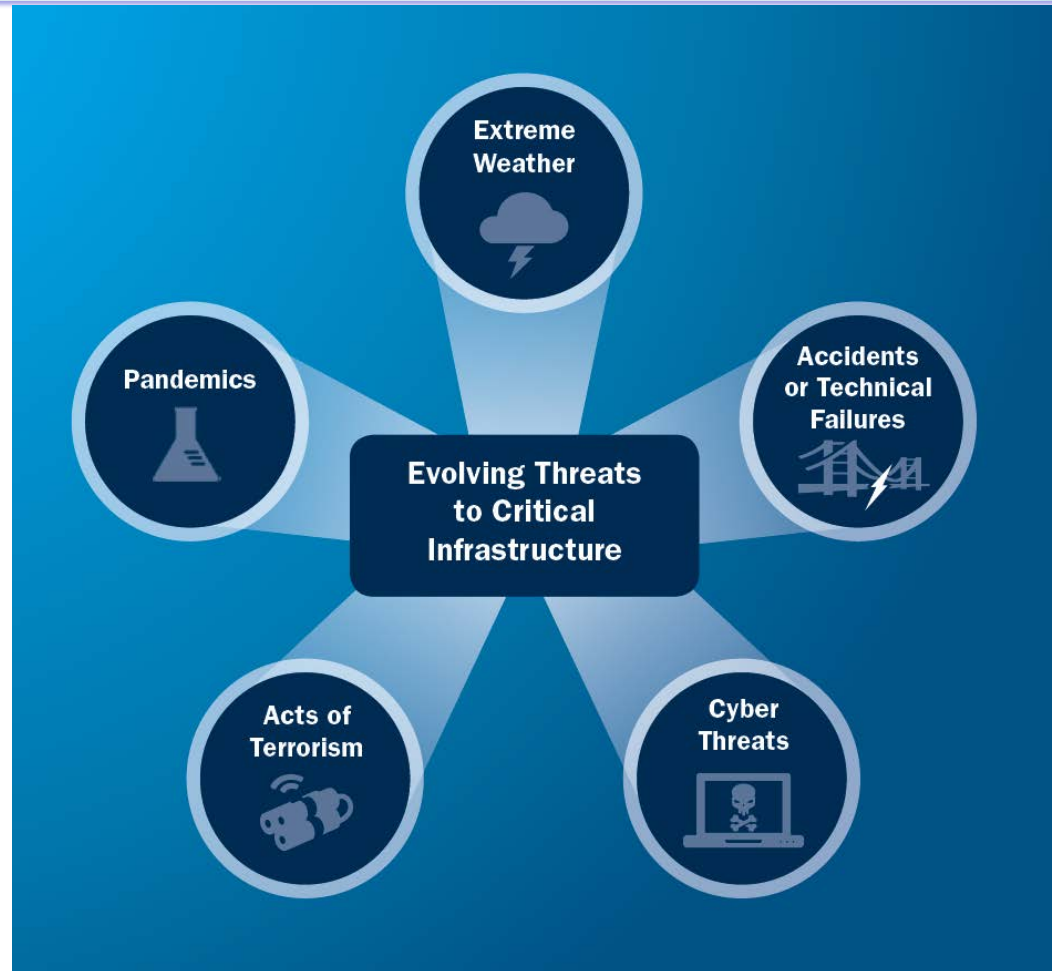

- ❑ Identifying the elements of critical infrastructure is fraught with difficulties; globally inconsistent
- ❑ Differ from country to country, but generally include:
 - ❑ transportation systems (air, rail, road, sea);
 - ❑ energy production and shipping;
 - ❑ government facilities and services, including, in particular, defense, law enforcement and emergency services ;
 - ❑ information and communication technology;
 - ❑ food and water;
 - ❑ public health and health care;
 - ❑ financial institutions.
- ❑ US=16 sectors; CA=10 sectors; EU=12 sectors; UK=9 sectors; JP=10 sectors.

U.S. Critical Infrastructure

- ❑ Less than 20% controlled by government
- ❑ Significant vulnerabilities exist
- ❑ Cybersecurity a major focus
- ❑ Interdependencies can result in cascading failures

Threat Landscape for Critical Infrastructure (CI)

U.S. Department of Homeland Security, *Strategic National Risk Assessment*, December 2011, <http://www.dhs.gov/xlibrary/assets/rma-strategic-national-risk-assessment-ppd8.pdf>. The full results of the SNRA are classified.

CI Protection

- ❑ **Catapulted to the forefront**
 - ❑ Several incidents of various nature
 - ❑ Widespread concern
 - ❑ Edge of cyber-warfare, state-sponsored actions

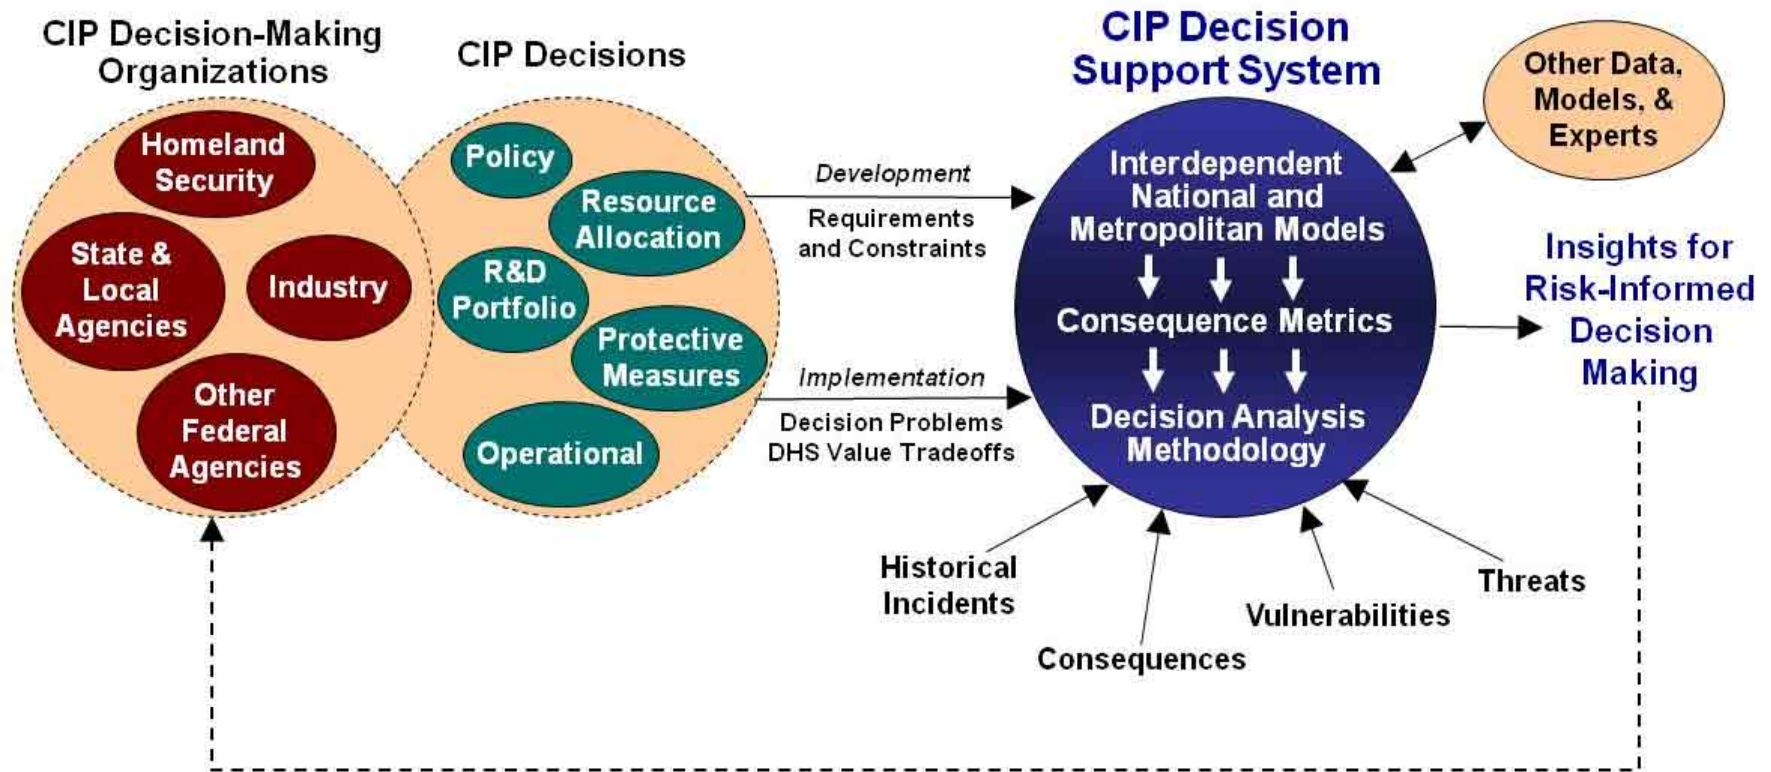

“National Emergency”

President Obama declared on April 1, 2015 that the rising number of cyberattacks against the United States is a national emergency and issued an executive order that would sanction those behind the attacks.

CI Protection Initiatives

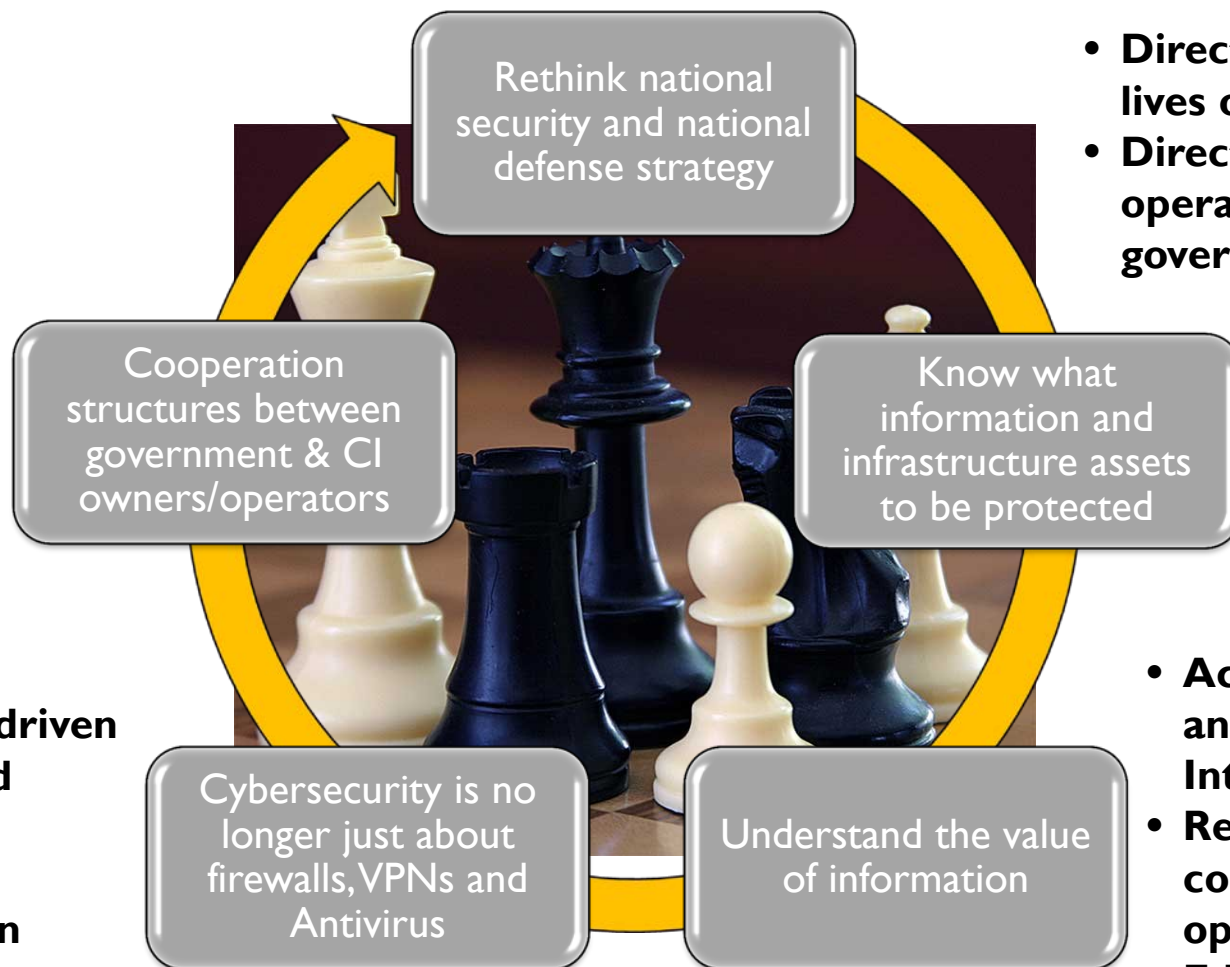

<http://www.lanl.gov/programs/nisac/cipdss.shtml>

Where is the U.S. public sector going?

- Info-sharing
- Threat mitigation
- Incident response

- Intelligence driven
- Dynamic and mobile
- Process and people driven

- Direct impact on the lives of citizens
- Direct impact on the operations of government

- Accidental loss and Open Source Intelligence
- Resilience and continuity of operations
- Educate the users

Changing ICT Landscape

...

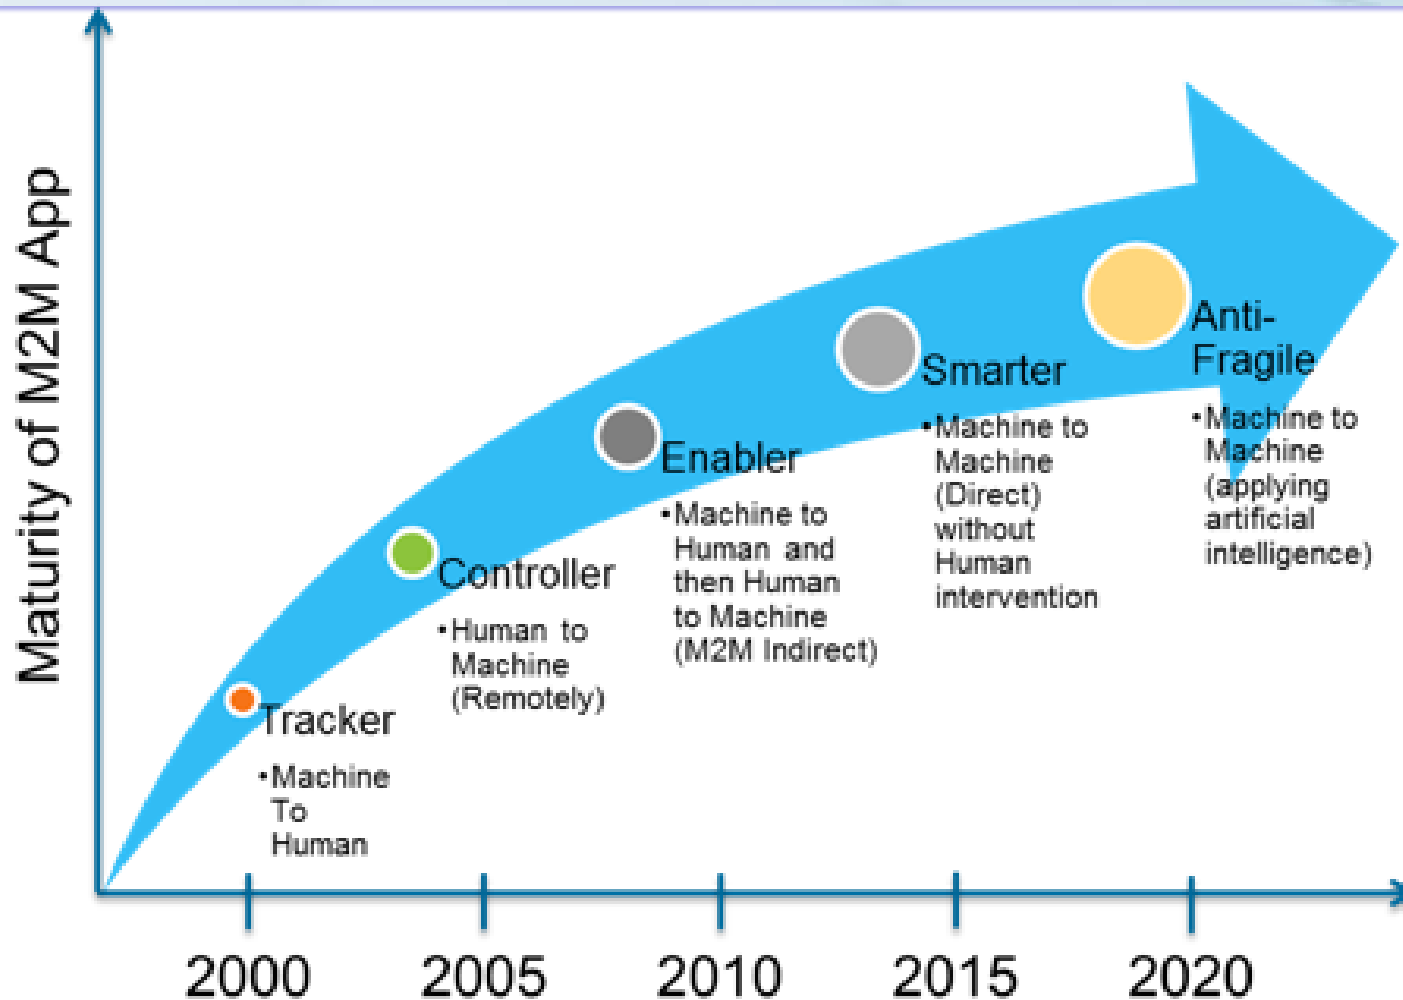

Disruptive Technologies

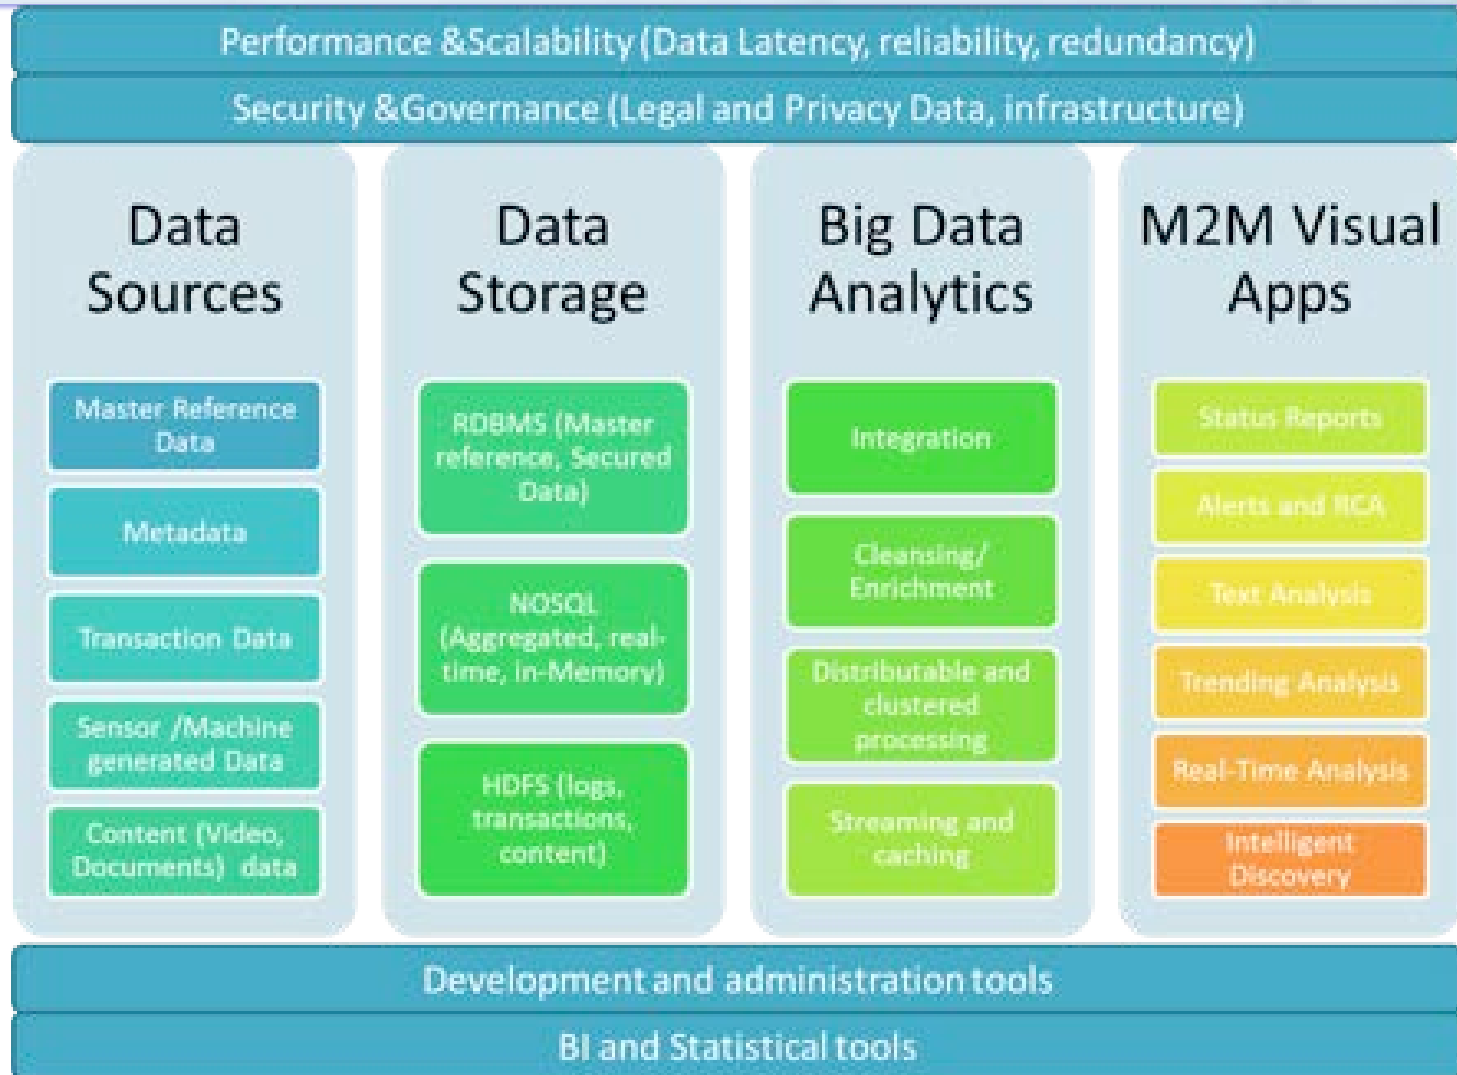

- ❑ Mobile computing
- ❑ Cloud computing
- ❑ Machine-to-machine (M2M)
- ❑ Big Data & Analytics
- ❑ Industrial Internet
- ❑ Internet of Things (IoT)
- ❑ Industry 4.0
- ❑ Software Defined “Anything”

- ❑ There are security & privacy issues for each
 - ❑ Complexity is compounded when they are used together

M2M Maturity

M2M analytics building blocks

How many IoT *things*?

Number of Connected Objects Expected to Reach 50bn by 2020

Penetration of connected objects in total 'things' expected to reach 2.7% in 2020 from 0.6% in 2012

Source: CCS, 2013

Greenfield

NOTE: EMC and IDC are somewhat more conservative, putting the 2020 IoT population at 32 billion, while Gartner comes in with 26 billion.

IoT Will Drive Big Data Adoption

- ❑ IoT technologies will allow for real-time and accurate data sensing and transmission of that data to Internet-based systems (Web, cloud, etc.)
- ❑ IoT will lead to an exponential increase in the data that an enterprise is required to manage
 - ❑ from appliances, from machinery, from train tracks, from shipping containers, from power stations
- ❑ Without the proper data-gathering in place (big data and analytics), it will be impossible for businesses to sort through all the information flowing in from IoT systems
 - ❑ without big data, the Internet of Things can offer an enterprise little more than noise

CI and Emerging Technology

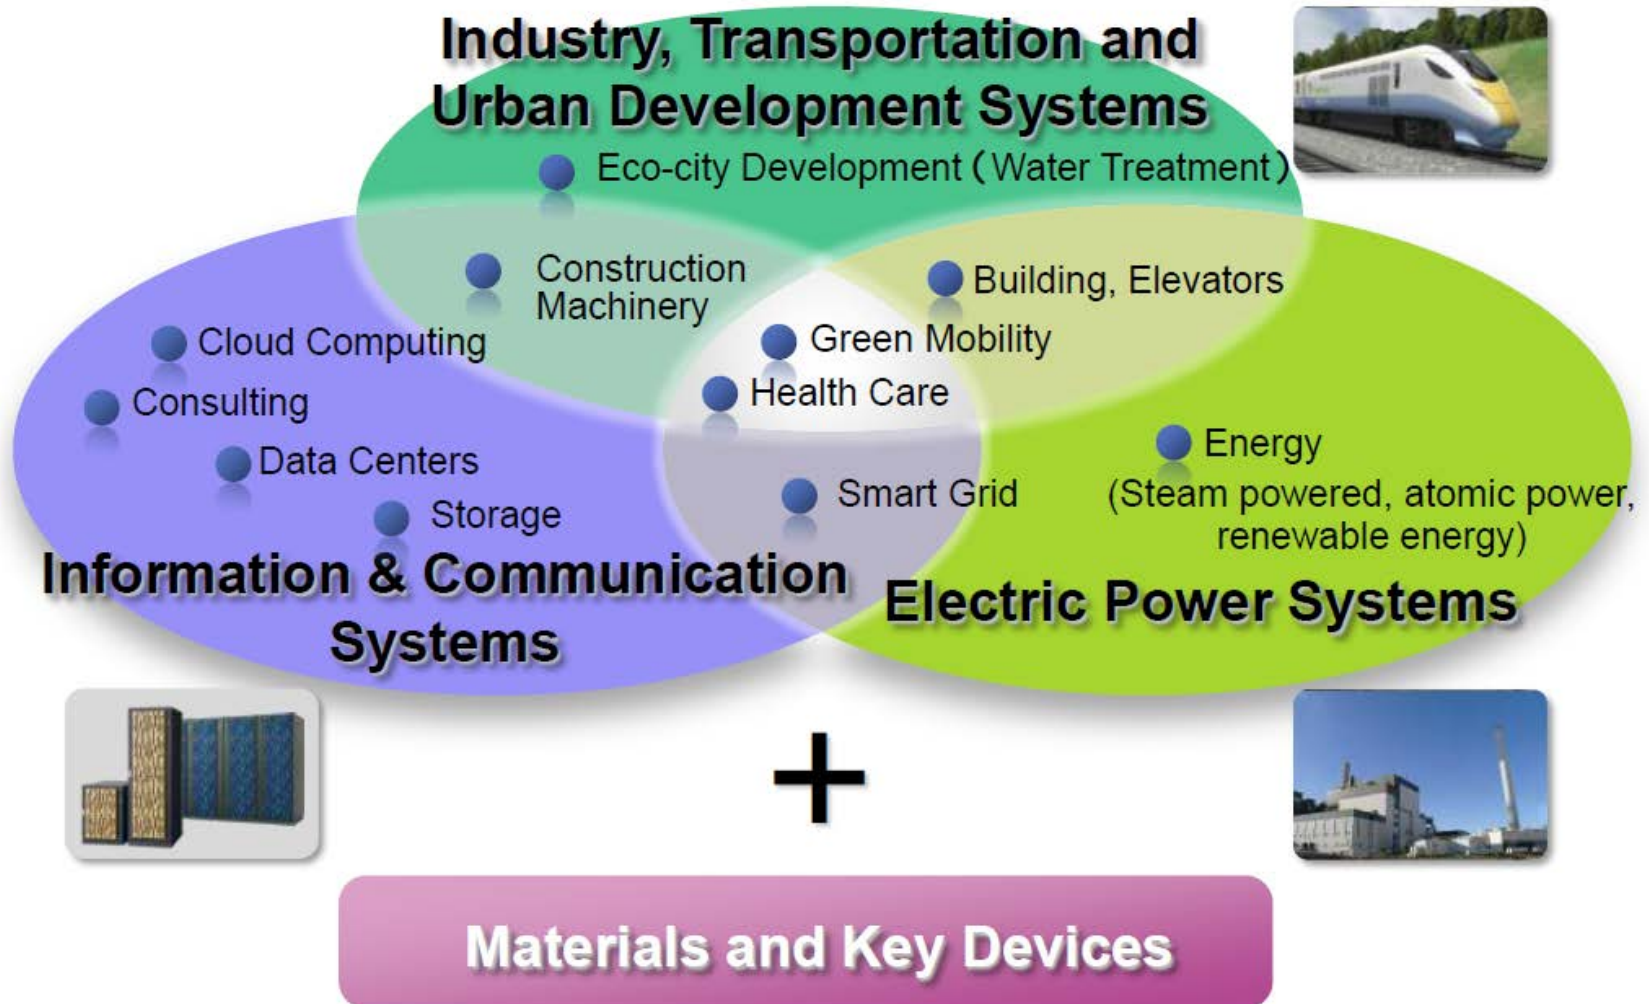

- ❑ Emerging technology has the potential of improving critical infrastructure
 - ❑ Reducing costs
 - ❑ Improving reliability and resiliency
 - ❑ Expanding capabilities
- ❑ Systems/IoT, need to be standardised, interoperable and open
- ❑ The risks have to be understood and mitigated
 - ❑ Security and safety must be embedded from inception
 - ❑ Assume failures and employ fail-safe or fail-secure solutions

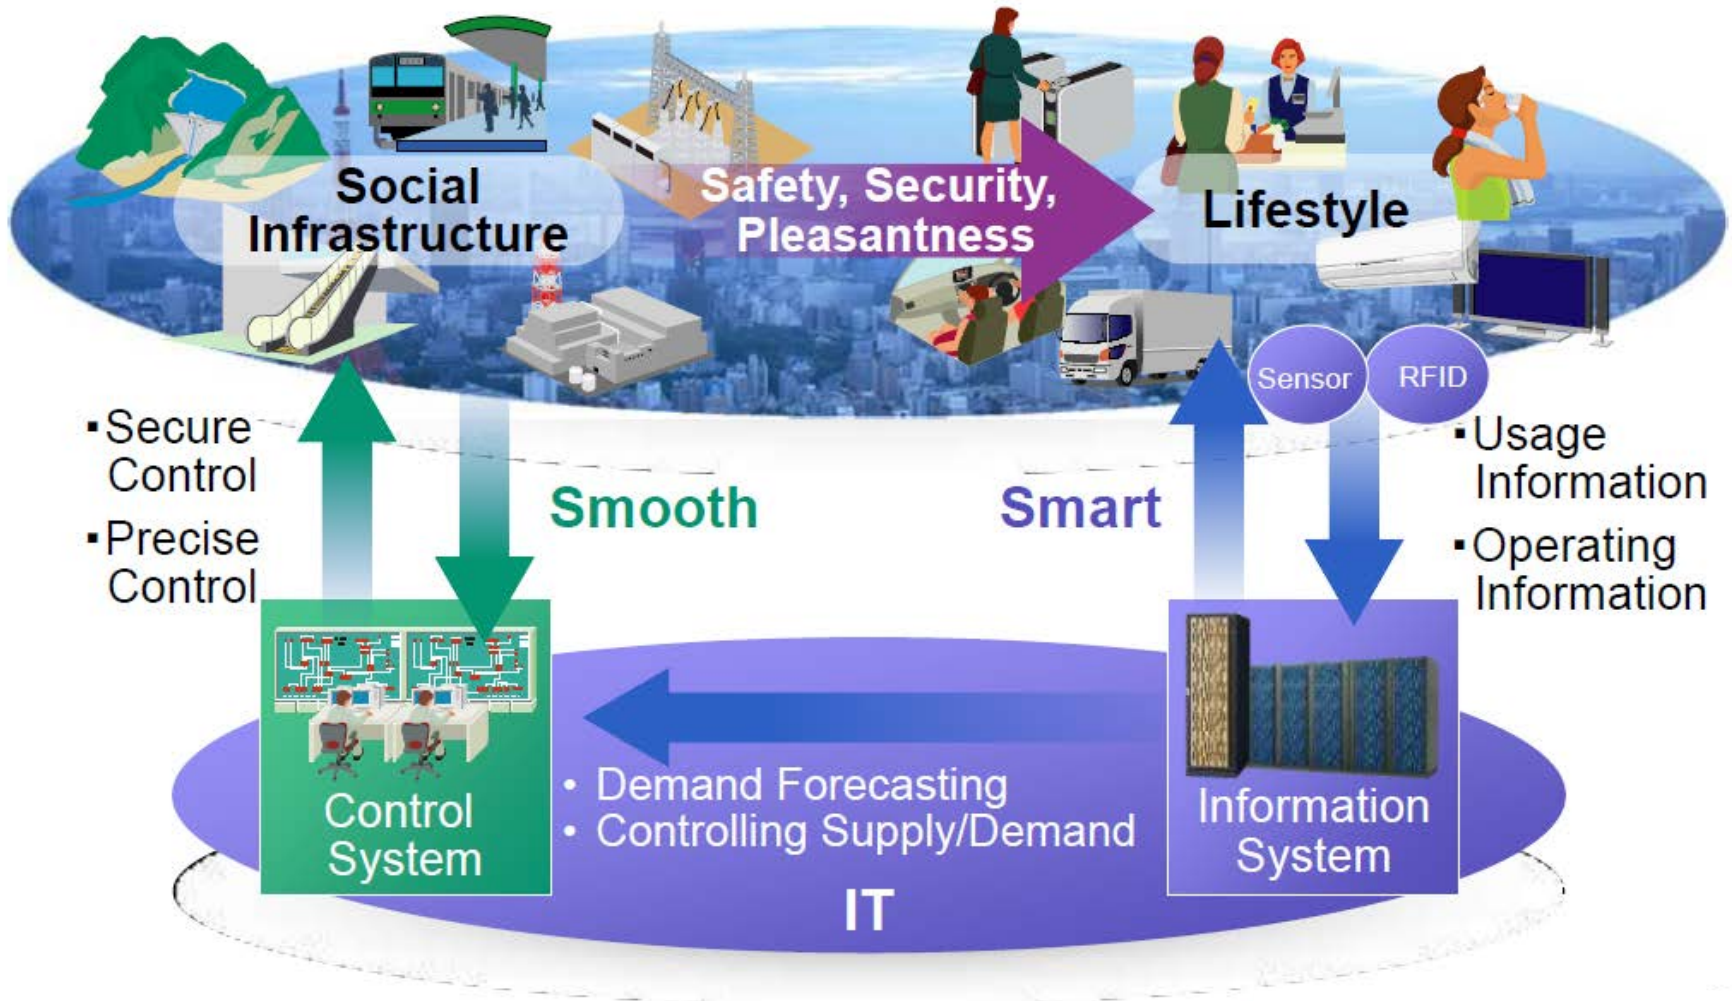

Looking to the Future

...

Social Infrastructure (Hitachi View)

Social Infrastructure Requires Collaborative Systems

Securing smart sustainable city systems

- ❑ Highly complex ICT systems
- ❑ Highly interconnected components (IoT)
- ❑ High volume of data

Securing the Smart Sustainable City

DATA
STORAGE
SECURITY
SUMMIT

Cyber-security

Resilience

Privacy

Compliance

Data integrity

Smart grids

Intelligent transportation

Connected healthcare

Public safety & security

Wireless & hotspots

Conclusions

- ❑ **Smart city deployments imply vulnerability**
 - ❑ Complex, heterogeneous ICT implementations
 - ❑ Diverse stakeholders
 - ❑ Hyper-connectivity, IoT, Big Data, Cloud Computing
 - ❑ Data is the digital currency - Data governance is the new focus
 - ❑ Intelligence + Processes + People + Tools
- ❑ **Cyber-attacks and data breaches are dangerous and costly**
 - ❑ Human lives - Data - Financial - Reputation - Credibility
- ❑ **Cyber-threats are here to stay**
 - ❑ Smart city must be conceived with *Cybersecurity* and *Resilience* in mind

Thank You
