

## **Enterprise Storage**

Leah Schoeb, Member of SNIA Technical Council

#### SNIA Emerald™ Training

SNIA Emerald Power Efficiency Measurement Specification, for use in EPA ENERGY STAR®

July 14-17, 2014

## What is an Enterprise Storage System?

## Storage is more than a device

- In general, we think of a box
- We look at the device attributes
  - Capacity
  - > Performance (speeds and feeds)
- It's really about storing and retrieving information with integrity, availability, data protection, cost
- Need a strategy and efficiency to address how we deal with information

60% ── Storage

% of IT Hardware Spend

## **Enterprise Storage System Basics**

## Storage System Basic Types

- Just a Bunch Of Disks (JBOD)
- Block Storage System
- File/NAS Storage System
- Solid State Storage Systems

## Architectural Designs

- Scale up
- Scale out

## Storage Technology

- Data Services
- Replication

## Just a Bunch Of Disks (JBOD)

- Multiple disk drives
- No RAID functionality
- Can be used as
  - Individual disk drives
  - One logical volume (spanning)
- No redundancy
- No performance enhancements
- Minimal to no data protection

## **Block Storage controller System**

Dual fans per power supply **Dual power supplies** 

Mirrored, battery-backed ECC cache memory

Fibre Channel front-end connectivity for multi-pathing

**Dual active-active controllers** 

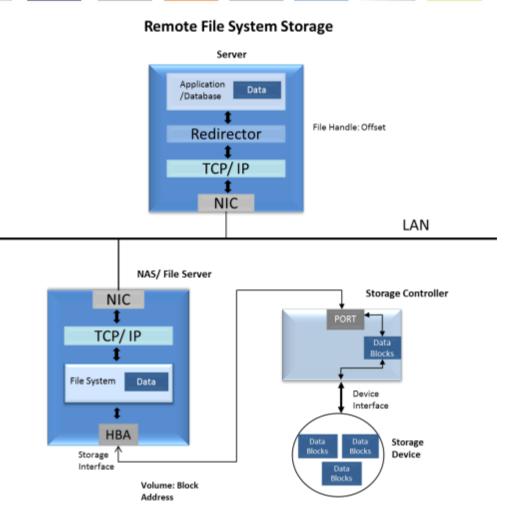

Dual \
management
ports

#### NAS

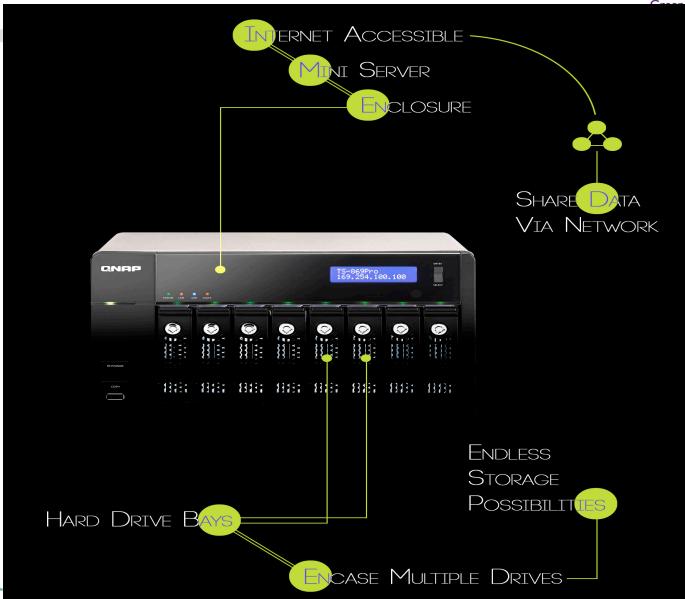

- Application writes file data to mounted file system
- File redirected over network
- NAS / File server takes file and converts to block I/O
- Data written to device as data block

## **NAS Storage System**

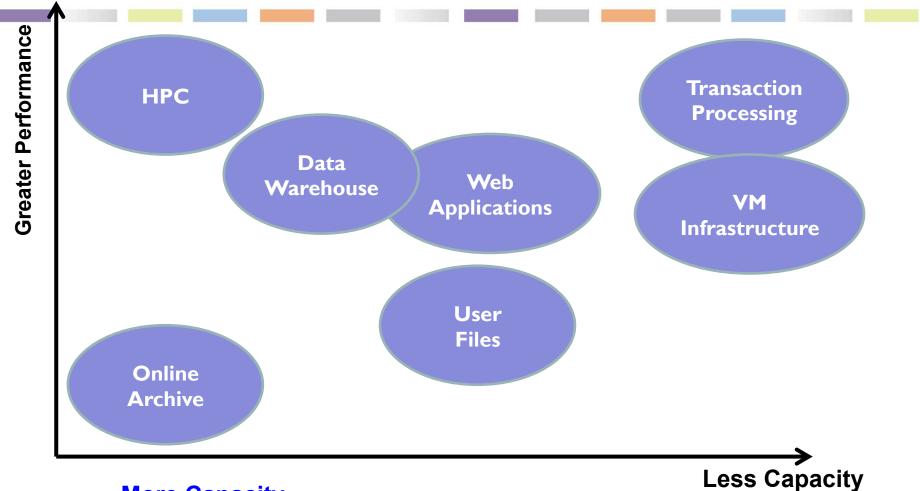

## **SOLID STATE ARRAYS**

## **Application Landscape for Solid State Storage**

**More Capacity** 

## Solid State Storage (Flash) Arrays

Flash DIMM Flash Module SSD SSD (or SSD) Flash Optimized **Traditional** Re-Architect Architected for Storage Systems Controller Controller Flash Disk replace Disk Replace Disk Replace - Virtual Tiering Hybrid Dynamic Dynamic **Tiering Dynamic** Tiering **Tiering**

**5X** 

**10X** 

## **Tiered Storage**

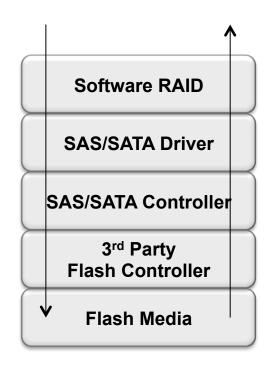

HDD Array	CPU 100	I/O 5	CPU 100
	microsec	milli sec	microsec
		(magnitude)	
SDD Array	CPU 100	I/O 500	CPU 100
ODD Allay	microsec	microsec	microsec
All Flash Array	CPU 100	1/0 100	CPU 100
AlliasiiAllay	microsec	micorsec	microsec
Server Side	CPU 100	I/O 25	CPU 100
Caching (PCIe)	microsec	microsec	microsec
		(magnitude)	
Flash DIMM	CPU 100	1/0 100	CPU 100
DMA (Motherboard)	microsec	nanosec	microsec

## Solid State Storage I/O Stacks

- New storage system architectures for all solid state
- Internal design to handle memory speed
  - PCle Internally
  - DMA to handle DRAM backup
- Manage technology characteristics
  - writes, cell sparing
  - Done with custom Flash controllers
  - Wear Leveling

## Modern All Flash Arrays vs. HDD Arrays

## **Modern Flash Arrays**

- Wear Leveling
- Garbage collection
- Metadata Management
- Self-healing techniques
- Inline Data deduplication
- Inline Compression
- SSD = 3-5 watts per device
- → Heat = 10 20 BTU/h per device

## **Traditional HDD Arrays**

- Rotational Latency
- Seek Times
- Mechanical parts
- Controllers designed to handle HDD
- HDD = 8-12 watts per drive
- Heat 30 40 BTU/h per drive

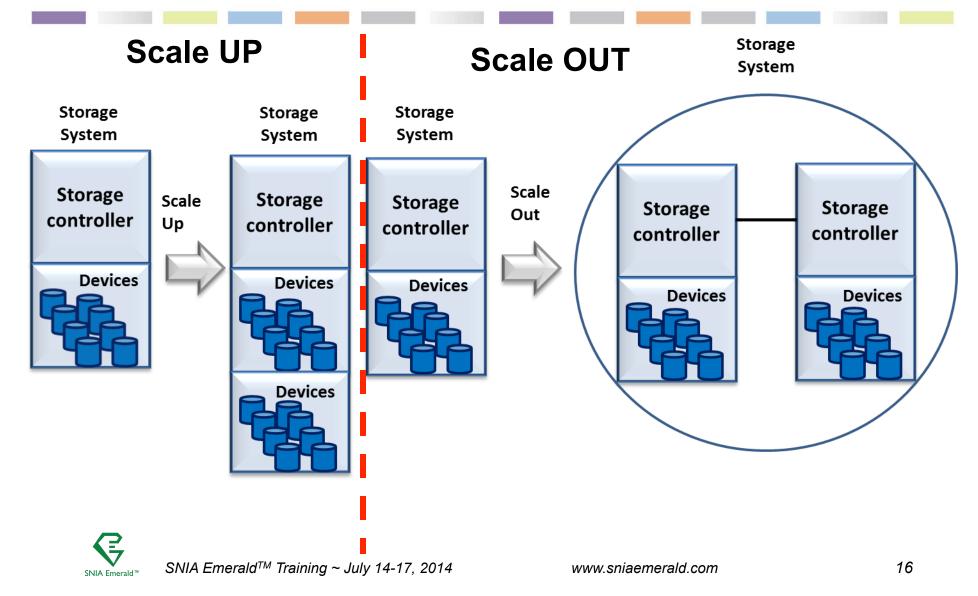

# Storage Technology SCALE OUT VS SCALE UP

## Scale Out vs. Scale Up

## Scale Out Storage: NAS

- Implemented using distributed file system usually
  - Clustered hardware
  - Global namespace across nodes
- Key implementation points
  - Linkage between nodes InfiniBand, Ethernet:10Gb
  - I/O balancing between nodes
  - Capacity balancing between nodes
  - Coherency across distance
  - Switching requirements

# Scale Out Storage: Block Storage

- Two approaches used
- Multiple controller cards to common backend storage device pools
  - Backplane connected typically
  - Normally associated with high-end enterprise systems
- Federation of separate controller nodes (included with NAS systems in some cases as integrated unified storage)
  - Complexities in cache coherency and I/O routing
  - Vendor differences

## Storage Technology

**DATA SERVICES** 

## **Considerations for Solid State Storage Arrays**

# Data Services Management

#### **Data Reduction**

- Deduplication
- Compression
- Thin Provisioning

#### Replication

- Local (writable)
- Remote (Future)

#### **Management**

- Non-disruptive upgrades
- REST APIs

## **Investment Protection**

### Self-healing techniques (Reliability)

## Hardware Redundancy (Availability)

#### **Serviceability**

## **Support**

#### **Hypervisor**

- VMware vSphere
- MS Hyper V

## Scale out and Clustering

**Application & OS** 

## Storage Technology

#### **REPLICATION**

## Why Replicate Data?

- Migrate data at same or different location
  - New technology or added capacity
  - Consolidations
  - Mergers
  - Workload balancing
- Application testing
- Data exchange for warehousing / mining
- Business continuance, Disaster Recovery, Data Protection
  - Motivated by:
    - > Business economics
    - RPO and RTO

> Legal requirements

## **Replication Technologies**

## Point-in-Time Copy – Snapshot / Flashcopy

- Space efficient copy only changed data
- Variations in storage system implementations

### Remote replication

- Synchronous continuous transfer of all data changed, operations wait until transfer completes
- Asynchronous data sent but operation continues without waiting for transfer completion
- Asynchronous periodic data sent periodically, most often is incremental snapshot

## **Types of Point-in-Time Copy**

#### Snapshot

- Copy-on-write only changed data is copied
- Redirect-on-write writes to new location
- Various implementations use pointer manipulations, side files, or dynamically allocated space from storage pool

## Cloning

- Makes a complete copy of data
- Clone may be continuous or split and later resynced
- Variations are differentiation points for vendors

## Remote Copy Approaches

### Synchronous

- Storage system-based or through fabric appliance
- Data must be stored at remote site before application can resume
  - > Significant impact on performance limits distance
- Application stops if I/O can't complete
  - May stall application

### Asynchronous

- Initially host software based, but system based is now available
- Application continues before data is stored on remote site
- Delayed write represents a window of "risk"
- continuous or periodic transmission of data

### Multi-hop or cascading

Combination of synchronous and asynchronous with intermediate storage system
