Leases (SMB 2.1)

Leases are work in progress, but can be considered almost done. Code already survives most test cases. Still need to fix a few corner cases... ⁽²⁾ Still hope to get Leases with 4.2?!...

smb(3)status (7/31)

D 14

Samea

- ▶ Samba had oplocks (SMB1/SMB2) since a long time.
- Oplocks per FSA level file handle.
- ▶ No need to keep extra information on SMB2 level.
- Leases identified by LeaseKey + ClientGUID.
- Can be shared by multiple opens.
- ⇒ Changes to open_files.idl
- ▶ SMB2 extra: LeaseKey generated by client, based on UNC path.

smb(3)status (8/31)

SerNet

- LeaseKey can not be attached to multiple UNCs.
- \blacktriangleright \Rightarrow Need to maintain additional SMB-level Data.

14

SAMBA

- Samba had oplocks (SMB1/SMB2) since a long time.
- Oplocks per FSA level file handle.
- ► No need to keep extra information on SMB2 level.
- Leases identified by LeaseKey + ClientGUID.
- Can be shared by multiple opens.
- ⇒ Changes to open_files.idl
- SMB2 extra: LeaseKey generated by client, based on UNC path.

 - Same //server/share

SAMBA

- different directory/file on disk!
- $\blacktriangleright \Rightarrow$ Client may "think" to access the same file

Michael Adam

 \blacktriangleright \Rightarrow Need to break leases and disallow simultaneouse leases.

smb(3)status (9/31)

Multi-Channel

Multi-Channel - Windows/Protocol

- find interfaces with interface discovery: FSCTL_QUERY_NETWORK_INTERFACE_INFO
- bind additional TCP (or RDMA) connection to established SMB3 session (session bind)
- bind only to a single node

14

Samea

- Client decides which connections to bind, which channels to use (fastest).
- replay / retry mechanisms, epoch numbers

Michael Adam

smb(3)status (11/31)

- find interfaces with interface discovery: FSCTL_QUERY_NETWORK_INTERFACE_INFO
- bind additional TCP (or RDMA) connection to established SMB3 session (session bind)
- bind only to a single node
- Client decides which connections to bind, which channels to use (fastest).

smb(3)status (11/31)

SerNe

replay / retry mechanisms, epoch numbers

Multi-Channel - Samba - Thoughts

- Samba/smbd: multi-process
- currently: process \Leftrightarrow TCP connection
- idea: transfer new connection to existing smbd
 - $\blacktriangleright \Rightarrow$ no need to coordinate between processes on unix file level
- use fd-passing (sendmsg/recvmsg) on TCP socket fd
- idea: don't transfer connection in session bind, but already in NEGPROT based on the ClientGUID
 - less state to coordinate

14

SAMBA

- ► ⇒ essentially single process model per ClientGUID even if multi-channel is not used
- ▶ rely on good async infrastructure for I/O (pthread-pool, ...)

・ロト ・回ト ・ヨト

smb(3)status (12/31)

SerNet

- ▶ only affects clients who send a Client GUID (SMB ≥ 2.1)
- possibly make this tunable-off(?)

- central daemon (or kernel module) to serve as RDMA "proxy" (libraries: not fork safe and no fd-passing)

smb(3)status (19/31)

smbd-d (rdma proxy daemon)

- listens on unix domain socket (/var/lib/smbd-d/socket)
- listens for RDMA connection (as told by main smbd)

main smbd:

- listens for TCP connections
- connects to smbd-d-socket
 - request rdma-interfaces, tell smbd-d on which to listen
- "accepts" new smb-direct connections on smdb-d-socket

smbd-d (rdma proxy daemon)

- listens on unix domain socket (/var/lib/smbd-d/socket)
- listens for RDMA connection (as told by main smbd)
- main smbd:

SAMBA

- listens for TCP connections
- connects to smbd-d-socket
 - request rdma-interfaces, tell smbd-d on which to listen
- "accepts" new smb-direct connections on smdb-d-socket

- client
 - connects via TCP \rightarrow smbd forks child smbd (c)
 - connects via RDMA to smbd-d
- smbd-d
 - creates socket-pair as rdma-proxy-channel
 - passes one end of socket-pair to main smbd for accept
 - sends smb direct packages over proxy-channel
- main smbd
 - ▶ upon receiving NegProt: pass proxy-socket to c based on ClientGUID

smb(3)status (21/31)

SerNet

► C

14

SAMBA

- continues proxy-communication with smdb-d
- For rdma_read and rdma_write:
 - c and smbd-d establish shared memory area

- client
 - connects via TCP \rightarrow smbd forks child smbd (c)
 - connects via RDMA to smbd-d
- smbd-d
 - creates socket-pair as rdma-proxy-channel
 - passes one end of socket-pair to main smbd for accept
 - sends smb direct packages over proxy-channel
- main smbd
 - upon receiving NegProt: pass proxy-socket to c based on ClientGUID

smb(3)status (21/31)

SerNet

- ► C
- continues proxy-communication with smdb-d

For rdma_read and rdma_write:

c and smbd-d establish shared memory area

- client
 - connects via TCP \rightarrow smbd forks child smbd (c)
 - connects via RDMA to smbd-d
- smbd-d
 - creates socket-pair as rdma-proxy-channel
 - passes one end of socket-pair to main smbd for accept
 - sends smb direct packages over proxy-channel
- main smbd
 - upon receiving NegProt: pass proxy-socket to c based on ClientGUID

smb(3)status (21/31)

SerNet

- ► C
- continues proxy-communication with smdb-d
- For rdma_read and rdma_write:
 - c and smbd-d establish shared memory area

Clustering

Clustering Concepts (Windows)

- Cluster:
 - ("traditional") failover cluster (active-passive)
 - protocol: SMB2_SHARE_CAP_CLUSTER
 - ► Windows:
 - runs off a cluster (failover) volume
 - offers the Witness service
- Scale-Out (SOFS):

SAMBA

- scale-out cluster (all-active!)
- protocol: SMB2_SHARE_CAP_SCALEOUT
- no client caching
- ▶ Windows: runs off a cluster shared volume (implies cluster)
- Continuous Availability (CA):
 - transparent failover, persistent handles
 - protocol: SMB2_SHARE_CAP_CONTINUOUS_AVAILABILITY
 - can independently turned on on any cluster share (failover or scale-out)

smb(3)status (23/31)
