

Version: 1.2.4a

Abstract: The Swordfish Scalable Storage Management API defines a RESTful interface and a standardized data model to provide a scalable, customer-centric interface for managing storage and related data services.

SNIA Standard

This document has been released and approved by the SNIA. The SNIA believes that the ideas, methodologies, and technologies described in this document accurately represent the SNIA goals and are appropriate for widespread distribution. Suggestion for revision should be directed to http://www.snia.org/feedback/.

DISCLAIMER

The information contained in this publication is subject to change without notice. The SNIA makes no warranty of any kind with regard to this publication, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. The SNIA shall not be liable for errors contained herein or for incidental or consequential damages in connection with the furnishing, performance, or use.

Suggestions for revisions should be directed to http://www.snia.org/feedback/.

Current Revision

SNIA is actively engaged in expanding and refining the Swordfish documentation. The most current revision can be found on the SNIA web site at https://www.snia.org/tech_activities/standards/curr_standards/swordfish.

Contact SNIA

Current SNIA practice is to make updates and other information available through their web site at http://www.snia.org.

FEEDBACK AND INTERPRETATIONS

Requests for interpretation, suggestions for improvement and addenda, or defect reports are welcome. They should be sent via the SNIA Feedback Portal at http://www.snia.org/feedback/ or by mail to the Storage Networking Industry Association, 4360 ArrowsWest Drive, Colorado Springs, Colorado 80907, U.S.A.

INTENDED AUDIENCE

This document is intended for use by individuals and companies engaged in storage management.

VERSIONING POLICY

This document is versioned material. Versioned material shall have a three-level revision identifier, comprised of a version number 'v', a release number 'r' and an errata number 'e'. Future publications of this document are subject to specific constraints on the scope of change that is permissible from one revision to the next and the degree of interoperability and backward compatibility that should be assumed between products designed to this standard. This versioning policy applies to all SNIA Swordfish versioned materials.

Version Number: Versioned material having version number 'v' shall be backwards compatible with all of revisions of that material that have the same version number 'v'. There is no assurance of interoperability or backward compatibility between revisions of a versioned material with different version numbers.

Release Number: Versioned material with a version number 'v' and release number 'r' shall be backwards compatible with previous revisions of the material with the same version number, and a lower release number. A minor revision represents a technical change to existing content or an adjustment to the scope of the versioned material. Each minor revision causes the release number to be increased by one.

Errata Number: Versioned material having version number 'v', a release number 'r', and an errata number 'e' should be backwards compatible with previous revisions of the material with the same version number and release number ("errata versions"). An errata revision of versioned material is limited to minor corrections or clarifications of existing versioned material. An errata revision may be backwards incompatible, if the incompatibility is necessary for correct operation of implementations of the versioned material.

Revision History

The evolution of this document is summarized in Table 1.

Table 1: Revision history

Date	Rev	Notes	
19 September 2016	1.0.0	Initial Release	
12 October 2016	1.0.1	Errata release for general clean up and formatting consistency	
1 November 2016	1.0.2	Errata release to change multiple collections' types from collections (arrays) to ResourceCollections to conform to Redfish usage guidelines	
		Change multiple collections' types from collections (arrays) to ResourceCollections to conform to Redfish usage guidelines and move NavigationProperties from Links section.	
24 January 2017	1.0.3	Errata release to move complex types and enum to versioned namespace	
		Schedule schema: add property	
		json schema fix (Swordfish to swordfish)	
		Specification enhancements, multiple areas	
		User's guide: multiple new use cases and new document section	
25 April 2017	1.0.4	Errata release with minor updates to schema: move FileShare collection, integrate DMTF and SNIA versions of Volume, fix incorrect property references and update descriptions. Update mockups. User's guide: Update cross-references.	
3 October 2017	1.0.5	Errata release to include schema simplifications and other lessons from initial implementations, as well as general cleanup of specification.	
13 February 2018	1.0.6	Updated Storage Systems model – added notion of Integrated Service Configuration in addition to (and named) Hosted Service Configuration	
		Added ComplexType common definition section	

Date	Rev	Notes
		Added/updated common Redfish property definitions
		Updates to conform to new SNIA templates.
12 October 2018	1.0.7	Enhanced Spare Capacity Management Model; Deprecated Remaining Capacity
		Added OpenAPI support: schema references and OpenAPI YAML files
		Added iSCSI properties for CHAP
		Event usage enhancements and guidance
		Volume schema updates – RAID Type enum (deprecating VolumeType usage), add ReplicaTargets
		Schema updates: Annotations enhancements: Capabilities designations, owning entities, Redfish.Required usage
		Clarified and updated ClassOfService IsDefault property usage
		Updated Capabilities location in hierarchy
		Fix cardinality issue of StorageReplicaInfo usage in StorageGroups and Volume
		Consolidate Client and Server Endpoint Groups into single Endpoint Group entity (deprecate usage of separate Client Endpoint Group and Server Endpoint Group)
		Add MappedVolume construct to StorageGroup – adds LUN info and other properties
		Clarified and updated ClassOfService IsDefault property usage
		Updated Capabilities location in hierarchy
		Fix cardinality issue of StorageReplicaInfo usage in StorageGroups and Volume

Date	Rev	Notes
		Consolidate Client and Server Endpoint Groups into single Endpoint Group entity (deprecate usage of separate Client Endpoint Group and Server Endpoint Group)
		Add MappedVolume construct to StorageGroup – adds LUN info and other properties
8 November 2018	1.0.7a	Restored RAIDType property that was missing from 1.0.7
		Minor correction to schema versioning
22 August 2019	1.1.0	Restructured to add features and profiles
		Add description of SupportedFeatures usage and requirements
		Add requirements for subsets of Add language to clarify support for use with and without the class of service (now an optional feature)
		Added descriptions of support for seamless extension of Redfish Storage model to Swordfish
		Add updated model diagrams to reflect new model permutations
		Added descriptions of new constructs (e.g., Consistency Groups)
		Cleaned up references to Redfish Specification based on latest version
		Add Status Codes clarification and constraints section
12 November 2019	1.1.0	Released as Technical Position
12 November 2019	1.1.0a	Released as Corrected Technical Position
		Formatting fixes – word wrap in pdf doc format to fix truncated lines
		Consistent object labeling in images (replace drive with disk)

Date	Rev	Notes
		Editorial and grammar changes and cleanup to status code guidance section
24 March 2020	1.1.0b	Released as Corrected Technical Position
		TLS requirements now based on both ISO and SNIA standards
		Redfish references now based on both ISO and SNIA standards
		Bibliography added
29 May 2020	1.2.0	Note: This release is done in conjunction with the DMTF's Redfish Forum Work-in-Progress June 2020 release of DSP-IS0014 (v0.95), which contains multiple schema to support this work. Both are released as Working Drafts / work-in-progress for public review, and plan simultaneous releases in early fall 2020 to support full technical specification level capability and availability.
		Functionality availability in Swordfish includes:
		 Enhancements to Volume, StoragePools
		New schema: NVMeDomain
		Other supporting documentation released in conjunction with this specification and schema bundle:
		 Multiple mockups reflecting multiple implementation permutation options (available on swordfishmockups.com)
		• Model overview documentation (NVMe to RF/SF Model Mapping Working Draft, dated May 2020)
18 August 2020	1.2.1	Note: This release is done in conjunction with the DMTF's Redfish Forum 2020.3 Release of the Redfish Specification, schema bundle and other supporting materials.
		Functionality availability in Swordfish includes:

Date	Rev	Notes
		 NVMe Mapping Support, Enhancements to Volume, StoragePools
		Additional Enhancements in the Specification and schema:
		 Added InitializeMethod property to Volume.
		 Made DedicateSpareDrives ReadWrite-able
		 Added enhanced Volume Access Capabilities and usage in StorageGroup.
		• Fix multiple URI issues across various schema.
		Updated formatting of tables to support automatic table numbering and ISO compatible table representation.
29 September 2020	1.2.1a	Added bibliography and updated TLS references
20 October 2020	1.2.1c	Updated with additional Redfish.URI annotations.
31 October 2020	1.2.1c	Released as SNIA Standard
2 March 2021	1.2.2	Added sections to document use of complex types.
		Updated common properties sections.
		Schema changes:
		Add actions to Add and Remove drives directly from StoragePool.
		Split NVMeFirmwareImage and NVMeDomains schemas.
		Deprecate use of NetworkPort; replace with Port.
		Update Redfish.URI references.
		Corrected \$ref references in JSON schema files.
		Fix incorrect references in deprecated JSON files.
30 August 2021	1.2.3	Adds updates / corrections to Redfish.URI annotations
		Add IsBootCapable to Volume

Date	Rev	Notes
		Add SupportedPoolTypes to StoragePool
5 December 2021	1.2.3	Release as SNIA Standard
12 April 2022	1.2.4	Release as Working Draft. Schema changes:
		• FeaturesRegistry: Errata fix – make Features property a collection.
		 IOStatistics: clarify intent regarding reset / wrap.
		 StoragePool: errata fixes for Actions.
		 Volume: errata fixes for Actions. Add: LBAFormatsSupported property to NVMeNamespaceProperties.
12 July 2022	1.2.4a	Release as SNIA Standard.
		Includes Errata fixes to multiple profiles.

About SNIA

The Storage Networking Industry Association (SNIA) is a non-profit organization made up of member companies spanning information technology. A globally recognized and trusted authority, SNIA's mission is to lead the storage industry in developing and promoting vendor-neutral architectures, standards and educational services that facilitate the efficient management, movement and security of information.

Acknowledgements

The SNIA Scalable Storage Management Technical Work Group, which developed and reviewed this work in progress, would like to recognize the significant contributions made by the following members listed in Table 2.

1 Abstract

The Swordfish Scalable Storage Management API ("Swordfish") defines a RESTful interface and a standardized data model to provide a scalable, customer-centric interface for managing storage and related data services. It extends the Redfish Scalable Platforms Management API Specification (DSP0266) from the DMTF.

2 Scope

2.1 Document Goals

Swordfish extends the Redfish Scalable Platforms Management API Specification to define a comprehensive, RESTful API for storage management that addresses block storage, file systems, object storage, and storage network infrastructure. It is centered around common operational and business concerns of storage management, including:

- Configuration and provisioning
- Monitoring
- Event and log management
- Performance assessment
- Diagnostics
- Fault detection and remediation
- Security
- Accounting and resource consumption

Swordfish's storage model is built around well-defined classes of service, which provide a means to map high-level business goals and objectives to specific, storagebased actions and requirements, in a clear and consistent way that can be applied uniformly across a broad spectrum of storage configurations and storage types (e.g., block storage, file systems, object stores). Common storage management functionality covered by class of service includes snapshots, replication, mapping and masking, and provisioning.

The Redfish specification provides the protocols and a core set of data models and behaviors for the management of systems. It defines the elements and behaviors that are mandatory for all Redfish implementations. Additionally it defines additional elements and behaviors that can be chosen by system vendors or manufacturers. The specifications also defines points at which OEM (system vendor) extensions can be provided by a given implementation. The specifications specifies normative requirements for Redfish Services and associated materials, such as Redfish Schema files. The Redfish specifications does not set requirements for Redfish clients, but will indicate what a Redfish client should do in order to access and utilize a Redfish Service successfully and effectively.

The Swordfish specification defines additional data models and behaviors for the management of storage systems and storage infrastructure. A Swordfish implementation shall conform to all requirements specified in the Redfish specifications. Swordfish is suitable for a wide range of storage, from small-scale object drives, integrated RAID cards or RBODs providing storage services, to external disk arrays or file servers, to infrastructure providing storage services for converged, hyperscale and large scale cloud environments.

This document defines the Swordfish Scalable Storage Management API.

2.2 Audience Assumptions

As Swordfish is designed as an extension of the Redfish specification, this document is written with the presumption that the reader has a detailed understanding of the Redfish specification. This document cannot be fully understood without that context.

3 Normative References

3.1 Overview

The documents referenced in Table 3 are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3.2 Approved references

The approved references that contribute to this document are summarized in Table 3.

4 Terms and Definitions

4.1 Overview

In this document, some terms have a specific meaning beyond the normal English meaning. Those terms are defined in this clause. New terms, frequently used Redfish terms.

4.2 Swordfish-specific Terms

4.2.1 Definitions

The terms listed in Table 5 are used in this document.

Table 5:	Swordfish	terms
----------	-----------	-------

Term	Definition
Entity	An instance of a schema element.
Model	A set of entities and the relationships between them that define the semantics, behavior and state of that set.
OData service	A REST-based service that allows resources, identified using Uniform Resource Locators (URLs) and defined in a model, to be published and edited by Web clients using simple HTTP messages.
Resource	A central element in a model, which represents a physical construct or a logical service, and is further defined by other model entities.
Schema	A formal language representation of a model that conforms to a metamodel.
Service Document	A particular resource that is directly accessed via an OData service entry point. This resource serves as a starting point for locating and accessing the other resources and associated metadata that together make up an instance of a Swordfish service.
Swordfish service	An extension to the Redfish Service that conforms to the Swordfish specification, and provides REST-ful storage management functionality.

4.2.2 Symbols and abbreviated terms

None in this document.

4.3 Reference to Redfish terms

Many terms in this document were originally defined in the Redfish Specification. Some of the more common terms and definitions are reproduced in Table 6, as an aid to the reader.

Table 6: Redfish terms

Term	Definition (as of 16 August 2019)
OData	The Open Data Protocol, as defined in OData-Protocol.
OData Service Document	Resource that provides information about the service root for generic OData clients.
Redfish Schema	Defines Redfish Resources according to OData schema representation. You can directly translate a Redfish Schema to a JSON Schema representation.
Redfish service	Implementation of the protocols, resources, and functions that deliver the interface that this specification defines and its associated behaviors for one or more managed systems.
Request	A message from a client to a service.
Service Root	Resource that serves as the starting point for locating and accessing the other resources and associated metadata that together make up an instance of a Redfish Service.

4.4 Keywords (normative language terms)

This document conforms to ISO/IEC Directives, Part 2 for keyword usage. The most common terms and their intended meanings are summarized Table 7.

Term(s)	Meaning
shall / shall not	Used to identify objectively verifiable criteria to be fulfilled and from which no deviation is permitted if compliance with the document is to be claimed
should / should not	Used to identify a suggested possible choice or course of action deemed to be particularly suitable without necessarily mentioning or excluding others
may / need not	Used to convey consent or liberty (or opportunity) to do something
can / cannot	Expected or conceivable material, physical or causal outcome
must	Identifies a constraint or obligation on the user of the document, typically due to one or more legal requirements or laws of nature, that is not stated as a provision of the standard <i>NB:</i> "must" is not an alternative for "shall", and should only be used for constraints that arise from outside this standard

Table 7: Normative language terms

5 Swordfish Overview

5.1 Introduction

The Swordfish Scalable Storage Management API ("Swordfish") defines a RESTful interface and a standardized data model to provide a scalable, customer-centric interface for managing storage and related data services. It extends the Redfish Scalable Platforms Management API Specification (DSP0266) from the DMTF.

5.2 Relation to Redfish

Figure 1: Model Overview

The Swordfish service interface extends the Redfish service interface. As such, a Swordfish service is a Redfish service and includes all required elements of the Redfish model, as illustrated by Figure 1.

The storage systems shall be instantiated in one of two places in the hierarchy: directly in the Storage resource collection, or - attached to a ComputerSystems, with an associated reference link in the StorageSystems resource collection at the Service Root. In this case, there shall also be a reference link to the Storage resource in the Storage resource collection at the Service Root.

As a result, a Swordfish client is always to locate the storage systems managed by the Swordfish service in the ServiceRoot via the Storage resource collection; this may be a combination of references to instances and instantiated instances.

The physical infrastructure is modeled using Redfish Chassis.

As modeling for storage systems may cover both logical and physical constructs, Swordfish management clients that are focused on logical storage management use cases may choose to manage functionality entirely by way of logical resources.

Each Swordfish service is accessed via well known URLs on the system supporting the Swordfish Service. Since Swordfish is an extension of Redfish, these URLs are the same as for accessing the Redfish defined aspects of the service.

5.3 Storage System Models

Swordfish has been designed to support a broad range of configurations, requirements, size and complexity, as well as logical and physical architectures. As a result, there are two primary methods of modelling the storage system for a Swordfish implementation:

1. Swordfish Standalone Configuration

The standalone configuration instantiates the logical storage system instance representation in the Storage resource collection directly off the Service Root. The logical storage system is modeled using the Redfish Storage and StorageController resources, as shown in Figure 2. Managed resources are connected to the Storage resource, including Volumes and StoragePools.

Figure 2: Logical Subsystem in Swordfish Standalone Configuration

This configuration works well for standalone devices or storage systems. An example of a Storage System for an standalone configuration is shown in Figure 3.

Figure 3: Swordfish Standalone Configuration Example

2. Swordfish Integrated Configuration

The integrated configuration attaches to the Storage collection within the same ComputerSystem model instantiation as the server where the physical element resides.

The logical storage system is modeled using the Redfish Storage and StorageController resources. The Storage resource is located in the Redfish hierarchy contained by ComputerSystems, typically running as ApplicationServers. The physical infrastructure is modeled using Redfish Chassis. Managed resources are connected to the Storage resource, including Volumes and StoragePools.

The integrated configuration is illustrated in Figure 4.

Figure 4: Logical Subsystem in Swordfish Integrated Configuration

This configuration works well when the storage system can be modeled by simply instantiating a new Storage object within an existing computer system. An example of a Storage System for an integrated configuration is shown in Figure ref{Figure_5}.
Swordfish Scalable Storage Management API Specification

Figure 5: Swordfish Integrated Configuration Example

5.4 The ServiceRoot and ServiceContainer entities

5.4.1 Overview

A **GET** of /redfish/v1 will return the ServiceRoot entity. A **GET** of /redfish/v1/odata will return the ServiceContainer instances that represents the OData service document. Each of these instances provides links to the remainder of the system.

The following are the elements utilized for Swordfish management.

- Storage: A reference to the Storage resource collection. - Systems: A reference to a Systems resource collection; - Chassis: A reference to a Chassis resource collection; -StorageSystems: A reference to a StorageSystems resource collection.

5.4.2 The Storage resource collection

A resource collection that references a set of Storage resources that each represents a storage subsystem. This collection can contain either resources or references to

instances of Storage resources. Each Storage resource represents an instance of a storage subsystem. For Swordfish subsystems, refer to the details in the Swordfish model overview for details on required elements.

5.4.3 The Systems resource collection

A resource collection that references a set of ComputerSystem resources that each represents a general purpose application server. Each ComputerSystem resource will have an entry with the value of "ApplicationServer" in its HostingRoles property. A particular ComputerSystem resource can be in both the StorageSystems collection and the Systems collection.

5.4.4 The Chassis resource collection

A resource collection that references a set of Chassis resources. Each Chassis resource represents physical containers, (i.e. sheet-metal confined spaces and logical zones like racks, enclosures, chassis and all other containers). Subsystems (like sensors), which operate outside of a system's data plane (meaning the resources are not accessible to software running on the system) are linked either directly or indirectly through this resource.

5.4.5 The StorageSystems resource collection

A reference to a ComputerSystemCollection with members of type ComputerSystem that support storage services. These ComputerSystem resources represent systems that support Swordfish storage management services. They will have an entry with the value of "StorageServer" in their HostingRoles property. This collection, then, is a resource collection that references a set of ComputerSystem resources that each represents a storage server. Each ComputerSystem resource will have an entry with the value of "StorageServer" in its HostingRoles property. A particular ComputerSystem resource can be a member of both the StorageSystems resource collection and the Systems resource collection.

5.5 Swordfish model overview

5.5.1 The Storage resource

The storage system exposes logical storage, associated resources and related functionality. Storage resources can be found in the service root or service container via the Storage resource collection, and are attached to the Storage object within the Storage resource collection.

The storage system typically provides the ability to create, manage and present block, file or object store from a set of back-end media, presented to one or more hosts. Storage controllers can work in coordinated sets of one or more to present value-add capabilities, such as failover, data protection, and data path management within the storage system, that are represented through the various resources within the storage system.

The following are the principal properties of Storage that point to resources managed or defined by the storage system:

- Controllers: A reference to a resource collection that collects StorageController resources.
- Drives: A reference to a collection that collects Drive resources used for storage.
- Enclosures: A reference to a resource collection that collects Chassis resources that contain storage related resources.
- Endpoints: A reference to a resource collection that collects Endpoint resources used to access storage.
- EndpointGroups: A reference to a resource collection that collects Endpoint-Groups resources.
- FileSystems: A reference to a resource collection that collects FileSystem resources.
- StorageGroups: A reference to a resource collection that collects StorageGroup resources.
- ConsistencyGroups: A reference to a resource collection that collects ConsistencyGroup resources.
- StoragePools: A reference to a resource collection that collects StorageGroup resources.
- Volumes: A reference to a resource collection that collects Volume resources.

5.5.2 The StorageController resource

The storage controller presents the foundational resources used by the storage system. It generally contains connectivity resources between the system and connected consumers.

5.5.3 The Endpoint resource

Endpoints represent one end of a protocol specific connection that supports sending or receiving messages according to a particular protocol.

5.5.4 The Endpoint Collection resource

The Endpoint Group is resource collection that references a set of Endpoint resources.

5.5.5 The ConsistencyGroup resource

ConsistencyGroups represent a set of volumes that are managed consistently and collectively as a group, to allow system and application level activities to be performed on a set of data that spans volumes. This activities include device-level replication activities as well as system level functions, such as reset.

When ConsistencyGroups are implemented, they are attached to a Storage resource and its internal Volumes collection is constructed from a subset of the Volumes collection of the Storage resource.

5.5.6 The ConsistencyGroup Collection resource

The ConsistencyGroupCollection is a resource collection that references a set of ConsistencyGroup resources.

5.5.7 The StorageGroup resource

StorageGroups represent a set of volumes that are managed as a group in order to facilitate mapping and masking, in which the volumes of a storage group are collectively exposed or hidden to a set of clients. The set of volumes is specified by the Mapped Volumes attribute. MappedVolumes is a resource collection of the Mapped Volume construct (a tuple of a pointer to a volume and a corresponding Logical Unit Number for that volume).

The set of client endpoints to which the volumes can be exposed is specified by the ClientEndpointGroupsattribute. The ClientEndpointGroup resource specifies a collection of EndpointGroup resources.

The set of server endpoints to which the volumes can be exposed is specified by the ServerEndpointGroupsattribute. The ServerEndpointGroup resource specifies a collection of EndpointGroup resources.

5.5.8 The StoragePool resource

The StoragePool resource represents unassigned storage capacity that can be used to produce storage volumes or other storage pools.

The following are the principal properties of StoragePool that are used to create or identify resources provisioned or supported by the storage pool:

- AllocatedVolumes: A reference to a resource collection that collects Volume resources that have been provisioned from the storage pool.
- AllocatedPools: A reference to a resource collection that collects StoragePool resources that have been provisioned from the storage pool.
- CapacitySources: A reference to a resource collection that provides pointers to the capacity sources that are used to provide the underlying capacity for this storage pool.
- RAIDTypes[]: The set of RAIDTypes supported by this StoragePool. This may be set upon StoragePool creation, or may be a reflection of the implementation's ability to support different RAID types. Consumers may use this property to determine what RAID types are available from specific StoragePool instances for additional Volume creation requests, or what RAIDTypes have been applied to Volumes already allocated.

5.5.9 The Volume resource

Volume resource represents a block-addressable container of storage, sometimes referred to as a "Logical Unit", "LU", "LUN", or "StorageVolume" in the storage industry.

5.5.10 The FileSystem resource

This FileSystem resource represents a file system. Each FileSystem may contain a collection of FileShares that can be presented to hosts.

6 Features and Profiles

6.1 Overview

Features are high-level descriptions of functionality which an implementation uses to advertise what functionality it currently supports, and for some features, is capable of supporting.

The detailed definitions required to describe to implementers how to implement a feature are written in profile definition files. A feature is generally represented in one (but may be more) profile definition file, or profile.

Profiles are detailed descriptions that describe down to the individual property level what functionality is required in order to advertise features. Different profile definitions can exist for the same feature type but for various types of storage configurations: Swordfish.Block.Provisioning, Swordfish.File.Provisioning

The Swordfish Features Registry shall be used to advertise what standard and Oem Features an implementation supports.

6.2 Requirement for SupportedFeatures

SupportedFeatures entries in the Features registry represent the client's primary initial runtime view of the capabilities of a Swordfish implementation. Without properly formed entries in this registry, there is no visibility to an implementation's functionality.

Swordfish implementations shall implement the Features registry and advertise at least the SNIA.Swordfish.Discovery supported feature in order to be considered a Swordfish implementation.

Features define coarse-grained sets of functionality. In order to advertise a feature (using the SupportedFeature mechanism in the SupportedFeatures Registry), the implementation must support the complete set of functionality as defined in the corresponding profile.

The Swordfish Features Registry publishes the official list of supported SNIA Features, and provides a high-level description of their functionality. Many of those features are self-explanatory (e.g., local replication, remote replication), but there are some features where additional context is appropriate:

- Class of Service
- Energy Star for Storage

6.3 EnergyStar for Storage Feature

The EnergyStar for Storage Feature and profile has been created to formalize the requirements from the ENERGY STAR Data Center Storage Program Requirements on storage products. The profile indicates what properties Swordfish implementations need to support in order to properly instrument EnergyStar reporting capability. This functionality is intended to support EnergyStar data gathering requirements as part of the EnergyStar certification process.

6.4 Class of Service Feature

6.4.1 Overview

Swordfish supports a ClassOfService feature. The ClassOfService functionality supports systems that are capable of providing a greater level of management automation, where a higher-level set of goals is provided as direction rather than requiring parameterized inputs for all configuration actions.

The Class of Service feature uses a combination of device-defined capabilities to structure LinesOfService, which are sets of available functionality in a given system, that can then be grouped together to provide classes of service.

When Class of service functionality is implemented, the Swordfish functionality may be entirely exposed through the StorageService resource. Each Swordfish StorageService is located in the ServiceRoot (and ServiceContainer) via the StorageServices resource collection.

6.4.2 Class of Service Model

For Swordfish with a class of service interface, the following two models apply. Either model choice results in the same storage service, regardless of the storage system model.

1. Integrated Service Configuration

The storage systems managed by the Swordfish storage service are modeled using the Redfish Storage resource and StorageController resource collections. The Storage resource is located in the Redfish hierarchy contained by ComputerSystems, typically running as ApplicationServers. The physical infrastructure is modeled using Redfish Chassis, as shown in Figure 6.

Figure 6: Logical Subsystem in Integrated Service Configuration

This configuration works well when the storage service is hosted by a storage resource within a computer system. An example of a Storage Service for an integrated service configuration is shown in Figure 7.

Note: This diagram and the discussion of the configuration description have been simplified slightly to avoid confusion. A full implementation would likely include additional links to the logical storage controller resources.

Figure 7: Integrated Service Configuration Example

2. Standalone Service Configuration

The storage systems managed by the Swordfish storage service are located in the ServiceRoot (and ServiceContainer) via the Storage resource collection. They model the logical storage system using Redfish Storage and 'StorageController' resources. The physical infrastructure is modeled using Redfish Chassis. This is shown in Figure 8.

This configuration works well when the standalone storage system directly hosts the storage service(s). An example of a Storage Service for a hosted service configuration is shown in Figure 9.

Note: This diagram and the discussion of the configuration description have been simplified slightly to avoid confusion. A full implementation would likely include additional links to the logical storage controller resources.

Figure 9: Standalone Service Configuration Example

6.4.3 ServiceRoot Additions

When the StorageService feature is implemented, the following is added to the ServiceRoot:

• StorageServices: A resource collection that references a set of StorageService resources. Each StorageService resource represents the resources and behaviors supported by that storage service.

6.4.4 The StorageService resource

6.4.4.1 Principal Properties The storage service is hosted on a storage system and exposes logical storage, associated resources and related functionality. Storage service resources can be found in the service root or service container via the StorageServices resource collection.

The following are the principal properties of StorageService that point to resources managed or defined by the storage service:

- ClassesOfService: A reference to a resource collection that specifies the supported ClassOfService resources.
- Drives: A reference to a resource collection that collects Drive resources used for storage.
- Enclosures: A reference to a resource collection that collects Chassis resources that contain storage related resources.
- Endpoints: A reference to a resource collection that collectsEndpoint resources used to access storage.
- FileSystems: A reference to a resource collection that collects FileSystem resources.
- EndpointGroups: A reference to a resource collection that collects Endpoint-Groups resources.
- StorageGroups: A reference to a resource collection that collects StorageGroup resources.
- StoragePools: A reference to a resource collection that collects StorageGroup resources.
- Volumes: A reference to a resource collection that collects Volume resources.
- HostingSystem: A reference to the ComputerSystem instance that hosts this StorageService.

6.4.4.2 Capabilities and Lines of ServiceRoot The following properties each define a set of attributes, which describe capabilities that the storage service may support:

- DataProtectionLoSCapabilities: Replicas that protects data from loss.
- DataSecurityLoSCapabilities: Data security service level requirements. The data security characteristics enable the storage system to be used in an environment where compliance with an externally-specified security standard or standards is required. Examples of such standards include FIPS-140, HIPAA and PCI.
- DataStorageLoSCapabilities: Provisioning and access characteristics for storage of the data.
- IOConnectivityLoSCapabilities: IO connectivity requirements for access to the data.
- IOPerformanceLoSCapabilities: IO performance requirements for access to the data.

In each of the above, not all combinations of attribute values defined within a capability are likely to be supported by the storage service.

Known, supported combinations of attribute values are used to construct entries in the LinesOfService array property. Not all attributes of a line of service entry need be specified (i.e. some may be Null). If an attribute has no value, the storage service may choose any supported values when provisioning for that entry. Otherwise, the line of service attribute values specifies the kind or level of service to be provided.

6.4.4.3 The ClassOfService resource A class of service represents a choice of utility or warranty offered to customers by a service. (ITIL uses the term service option. See the Normative References.)

Each ClassOfService resource is a uniquely named description of the characteristics of one choice of utility or warranty for a service. Each ClassOfService is a description of the kind and quality of service to provide and is not intended to describe how the service provides that service.

Each ClassOfService is defined by an aggregation of lines of service. Supported lines of service are listed in the corresponding capabilities attributes of the storage service, (see above).

Currently defined lines of service are:

• Data Protection: Describes the characteristics of a replica that protects data from loss.

- Data Security: Describe data security service level requirements. The data security characteristics enable the storage system to be used in an environment where compliance with an externally-specified security standard or standards is required. Examples of such standards include FIPS-140, HIPAA and PCI.
- Data Storage: Describes provisioning and access characteristics for storage of the data.
- IO Connectivity: Describes IO connectivity requirements for access to the data.
- IO Performance: Describes the IO performance requirements for access to the data under a particular workload.

Some advertised ClassOfService resources are created by the service implementation. These are generally not changeable and are intrinsic to the implementation.

A service may support creation or modification of ClassOfService resources. All must be consistent with the capabilities of the service.

6.4.4.4 The StoragePool resource When a Swordfish implementation advertises support for the Class of Service feature, the StoragePool resource now presents a new method to the client to allocate unassigned storage capacity. This is automated by the system as conformance to one or more classes of service. Requests to StoragePool shall automatically allocate capacity based on the constraints of the selected class of service and any other selected parameters, with priority given to the class of service constraints.

The following are the principal properties of StoragePool that are used to identify resources provisioned or supported by the storage pool related to Class of Storage:

- ClassesOfService: A reference to a resource collection that specifies the set ClassOfService resources that can be specified when provisioning resources from the storage pool.
- DefaultClassOfService: A reference to the default ClassOfService resources used for provisioning from the storage pool.

6.4.4.5 The Volume resource Volume resource represents a block-addressable container of storage, sometimes referred to as a "Logical Unit", "LU", "LUN", or "StorageVolume" in the storage industry. Volumes optionally adhere to a ClassOfService, which defines added functionality. Examples include:

- Access capabilities
- Capacity and capacity sources

- Consumption tracking (e.g., LowSpaceWarningThresholdPercents)
- Replication details
- StorageGroup Information

6.4.4.6 The FileSystem resource In a Swordfish implementation that advertises support for the Class of Service feature, File systems represent file-addressable capacity that are conformant to a ClassOfService.

7 Schema Considerations

7.1 Schema Introduction

7.1.1 Overview

A Swordfish implementation is a Redfish implementation, and as such it minimally includes support for some Redfish-defined schema, including ServiceRoot and ComputerSystem. Swordfish implementations include support for Swordfish-defined schema. The Swordfish model focuses primarily on the logical model of a storage system and does not require full representation of a physical instantiation. This is left to the implementer to complete from available Redfish schema models.

Swordfish schema is conformant with the rules used to define Redfish schema. Redfish schema is conformant with the Common Schema Definition Language, see CSDL. This section provides additional definition and context for the CSDL elements used to define Swordfish schema.

7.1.2 Swordfish Extension of the Redfish ServiceRoot

The Redfish ServiceRoot has properties that provide access to Swordfish resources.

The first is StorageSystems. This property references a collection of ComputerSystem resources that each support Swordfish functionality. Each such ComputerSystem shall have an entry in its HostingRoles property with the value of StorageServer.

For implementations that advertise support for the ClassOfService feature, the implementation shall instantiate a collection of StorageServicesat the ServiceRoot with at least one member. The collection provides the client an efficient means to search across all StorageService resources, regardless of which ComputerSystem is supporting the service.

7.2 Default values and NULLABLE attributes

The interaction of Nullable and DefaultValue needs to be clearly understood by both implementers and client developers. The possible combinations of are summarized in Table 8. The table contains:

- Nullable: True, if a given property may be NULL
- **DefaultValue**: True, if a default value is provided for a given property

- **Client**: True, if a client value is supplied for a given property in a query or response
- **Result**: The resultant value of the given property. One of:
 - C: The client-provided value
 - D: The default value
 - *Null*: Null
 - *I*: Implementation defined
 - Error: Error state

Table 8: Default and Nullable Interaction

Nullable	DefaultValue	Client	Value
Т	Т	т	С
Т	Т	F	D
Т	F	т	С
Т	F	F	I or Null
F	Т	т	С
F	Т	F	D
F	F	т	С
F	F	F	l or Error

7.3 Common schema annotations

Table 9 lists common annotation used in the definition of Swordfish, for details see OData Capabilities Vocabulary, OData Core Vocabulary, OData Measures Vocabulary, and Redfish Extensions.

Table 9: Schema	annotations
-----------------	-------------

Name	Applies to	Description
AllowableValues	Parameter	The set of allowable
		values for a parameter

Swordfish Scalable Storage Management API Specification

Name	Applies to	Description
AutoExpand	NavigationProperty	If true, return expand the target element
AutoExpandReferences	NavigationProperty	If true, return references to the target element
ConformanceLevel	EntityContainer	Specifies OData conformance level
Deprecated	All	Specifies that the element may be removed in future major revisions, but shall continue to be supported as specified in the current revision.
Description	All	A brief description of a model element
LongDescription	All	A normative description of a model element
Maximum	Parameter, Property	Maximum value that an integer property or parameter may have
Minimum	Parameter, Property	Minimum value that an integer property or parameter may have
Pattern	Parameter, Property	Specifies a pattern that the value shall match
Permissions	NavigationProperty, Property	Access permission for the property.
Required	NavigationProperty, Property	If true, property is required to be supported by the service. The default is optional. See <i>Required Propertie</i> s
RequiredOnCreate	NavigationProperty, Property	If true, property is required on creation. See <i>Required Propertie</i> s

Name	Applies to	Description
Unit	Property	The unit of measure for the value.

7.4 Property implementation requirements

The client and the implementer should understand that, regardless of the schema declaration, an implementer may choose to not implement a property. If not implemented, a representation of the property will not be present in a reply. This should not be confused with a response that indicates that a property has been implemented, but has no value (i.e. *propertyName = null*).

There are several factors that could affect the implementation choice. Implementation requirements can be defined in many documents. At a minimum, a developer should review, in order: 1. the Redfish specification, 2. this document, and 3. associated profile specifications.

7.5 Schema repository

The primary online source for the Swordfish schema shall be co-located on the DMTF schema site with the Redfish schema: http://redfish.dmtf.org/schemas/swordfish Developers may also download the schema as part of the Swordfish bundle from snia.org (refer to snia.org/swordfish for pointers to the bundle locations).

Implementations should refer either to the versions available on the dmtf.org site or to locally provided instances of the schema.

7.6 Referencing other schemas

Swordfish directly references many Redfish schemas when functionality is already defined and can be leveraged. Other Redfish schema may be added by inference or directly to implementations. Examples are available in the Swordfish mockups.

8 Implementation requirements

8.1 Security

This document generally adheres to the security requirements defined in the Redfish Specification. It extends the Redfish security model in one important way:

Swordfish implementations shall implement TLS as per the guidance in [ISO/IEC 20648](#normat

8.2 General constraints

8.2.1 Redfish elements

The Swordfish service interface extends the Redfish service interface. As such, a Swordfish service is a Redfish service and all required elements of the Redfish model shall be present in a Swordfish model.

Swordfish functionality shall not conflict with any previously defined Redfish functionality but it may add to or extend it, and it may add additional constraints on Redfish functionality.

Additionally, any functionality desired in a Swordfish implementation that is specified in Redfish shall follow the requirements as specified in the Redfish specification.

8.2.2 Storage Events

8.2.2.1 Overview A Swordfish implementation should implement an event service. Redfish defines the Event Service framework, client subscription model, event delivery mechanism, as well as standard message registries. Swordfish extends the standard message registries to provide additional message registries that correspond to Swordfish-specific services and properties.

The Redfish event service publishes a list of event types supported, and maintains a list of clients that have subscribed. Each subscription maps clients, subscribed events, and the resources that generate them.

8.2.2.2 Message Registry Selection and Management Swordfish constrains the existing event model to provide a more consistent handling of event notifications and the related messages, in order to assure that client systems can easily and consistently parse and respond to system-level events.

8.2.2.3 Required Usage

- The Resource Event Message Registry defines the underlying messaging model, and shall be used to map messages to resources for storage implementations.
- The Redfish Base Message Registry shall be used to support HTTP connection/error/protocol issues, and general errors.
- The Swordfish Message Registry shall be used as a supplement for the resource event message registry.
- If the Swordfish service implements Redfish tasks (i.e., long-running operations), the implementation shall use the messages defined in the Task Event Message Registry to report status.

8.2.2.4 Recommended Usage

- Standard Messages should be used, wherever possible.
- OEM messages should be avoided. Suggestions for clarification or expansion of the existing registries are encouraged. (submissions should be sent to the SNIA Feedback Portal)

8.3 Discovering Swordfish resources

Each Swordfish implementation supports the following well-known URLs, as defined in Redfish. Specifically:

- /Redfish, which contains one or more version properties for the integrated Swordfish and Redfish implementation, starting with v1.
- /Redfish/v1, which addresses a ServiceRoot instance, which defines the Redfish default principal starting information for version 1 implementation of an integrated Redfish and Swordfish service. A GET operation to it shall retrieve the value of an instance of a ServiceRoot EntityType as defined in the Service-Root_v1.xml file.
- /Redfish/v1/odata, which addresses a ServiceContainer instance, which defines OData conformant principal starting information for the same version 1 implementation of an integrated Redfish and Swordfish service. A GET operation shall retrieve the value of an instance of a ServiceContainer EntityContainer as defined in the ServiceRoot_v1.xml file.

Note: Since the ServiceContainer is required to return an @odata.context value

of /redfish/v1, all other elements accessed via it will be the same elements found via the ServiceRoot.

Note: A Swordfish service is a Redfish service with extensions to support storage management. No additional service entry-points are necessary.

Both the ServiceRoot and ServiceContainer contain a resource collection named Systems that lists ComputerSystem instances. A ComputerSystem instance that supports Swordfish defined services will have a value of "StorageServer" in an entry of its HostingRoles property.

The ServiceContainer additionally has a Service attribute that references the ServiceRoot resource.

Regardless of starting point, the property values of the ServiceRoot instance enable navigation to all other resources exposed by the Swordfish service.

8.4 ClassOfService requirements

Each ClassOfService shall include at least one line of service. The providing server shall assure that the line of service values of a ClassOfService collectively represent a supported choice of service.

8.5 StorageSystems requirements

For Hosted Service Configurations, this property of the ServiceRoot references a collection of ComputerSystem resources that each support Swordfish functionality. Each ComputerSystem included in the StorageSystems entry in the ServiceRoot shall have:

- an entry in its HostingRoles property with the value of StorageServer
- at least one entry in its StorageServices.Members property.

For Integrated Service Configurations, the StorageSystems concept is realized through the StorageController resource. Each StorageController instantiated as a Swordfish StorageSystem shall have:

• at least one entry in its StorageController.Links property StorageServices collection identifying related StorageServices

8.6 Entity Sets

The Swordfish model does not currently expose any explicitly defined entity sets. OData specifies that an entity set is defined for each NavigationProperty that is defined as a collection and that has the ContainsTarget attribute set to true. In all other cases, Swordfish assumes that an entity set is defined globally within the implementation for each entity type. This is effectively the same as if the entity sets were explicitly defined in the ServiceRoot entity container.

8.7 Addressing entities within a collection

An instance (entity) of an EntityType is uniquely identified within its entity set by its key. The URI for the reference may specify the key using one of two general strategies

- 1. OData recommends specifying the key value within parenthesis following the path segment that identifies the referencing entity set. (See clause "Canonical URL" in in OData)
- 2. Redfish common practice is to use an alternative form that adds a path segment having the value of the key following the path segment that identifies the referencing collection. (See clause "Alternate Key-as-Segment Syntax" in OData.)

A Swordfish implementation shall support both strategies.

8.8 Addressing members of a ResourceCollection

Redfish specifies that subclasses of ResourceCollection shall include a Members collection property (See clause "Collection resource response" in DSP0266)

Redfish allows a POST request to a ResourceCollection to be equivalent to the same POST request to the Members property of that ResourceCollection. For a particular ResourceCollection, if a Swordfish implementation supports either form, it shall support both.

It is common practice in Redfish to also eliminate the Members property from any request URI that navigates through a type hierarchy that includes a Member within a ResourceCollection. Care should be taken when defining and using a ResourceCollection subclass to not introduce ambiguities when an explicit reference to a Members property is dropped from a request URI.

8.9 HTTP status codes

8.9.1 Overview

Status codes are generally defined as part of the general HTTP protocol definition. In addition, the Redfish specification calls out general usage for HTTP status codes. This section provides additional usage guidance and constraints for Swordfish implementations.

In some instances, Redfish and Swordfish expand the standard use of HTTP status codes by associating additional system status with specific status codes. In addition, error response data may be included via standardized message registry entries. The specific messaging requirements will be defined in the following sections.

In cases where Swordfish adds additional constraints or expands on the Redfish handling of a given issue, this document will include a small wording extract from the Redfish specification for additional context. For example:

Swordfish refines the requirements in the *Redfish Specification*: Redfish has no constraint on external storage functionality to require that all references to external storage functionality shall be compliant with the current release of Swordfish.

8.9.2 Create

If a request to create a resource can be completed successfully without additional time, the Redfish service shall return a status code of 201, and the body of the response shall contain the JSON representation of the newly created resource.

If the create resource request has been accepted, but no information about the resource can be returned at this point, the Redfish service shall return a status code of 204. The payload of the response shall be empty, but the Location header shall contain the resource URI. The client will be required to poll the appropriate resource to determine both when and if the operation is complete.

Swordfish refines the requirements in of the *Redfish Specification* (see "Data modification requests overview" and "Asynchronous operations").

If a request to create a resource cannot be completed without additional time, the implementation shall:

- Populate an initial object. It shall contain, at a minimum, a valid URI, required properties (e.g., ID, name), and Status.State;
- Set Status.State of the partially populated resource to "Creating";

- Return the appropriate status code, based on the following guidance:
 - If a Task Service has been implemented, the Redfish service shall return a status code of 202, with the Location header set to the URI of the Task Monitor. Once the provider has returned a Task Monitor to the client, the Client can then query the provided task URI to track the task completion status. Upon task completion, a GET against the task monitor may return a status code of 201, and the body of the message shall contain the created resource, provided the task monitor URI remains valid. Refer to the Redfish Task Manager documentation for the lifecycle of the task monitor URI.
 - If a Task Service has not been implemented, the Redfish service shall return a status code of 201, and the body of the response shall contain the URI of the skeletal resource created as part of accepting the request. The client will be required to poll the URI provided to determine when the operation is complete.
- Update Status. State for the object, once the create operation completes.

8.9.3 Update, Replace, Delete

If a request to modify or delete a resource can be completed without additional time, the Redfish service shall return a status code of 200, and the body of the response shall contain the JSON representation of the modified (or deleted) resource.

If the resource modification or deletion request has been accepted, but no information about the resource can be returned at this point, the Redfish service shall return a status code of 204. The payload of the response shall be empty. The client will be required to poll the appropriate collection to determine both when and if the operation is complete.

If a request to modify a resource cannot be completed without additional time, the implementation shall:

- Set Status.State of the partially populated resource to "Updating" or "Deleting", as appropriate;
- Return the appropriate status code, based on the following guidance:
- If a Task Service has been implemented, the Redfish service shall return a status code of 202, with the Location header set to the URI of the Task Monitor. Once the provider has returned a Task Monitor to the client, the Client can then query the provided task URI to track the task completion status. Upon task completion,

a GET against the task monitor may return a status code of 201, and the body of the message shall contain the created resource, provided the task monitor URI remains valid . Refer to the Redfish Task Manager documentation for the lifecycle of the task monitor URI.

- If a Task Service has not been implemented, the Redfish service shall return a status code of 200, and the body of the response shall contain the URI of the skeletal resource created as part of accepting the request. The client will be required to poll the URI provided to determine when the operation is complete.
- For an update or replace request, the implementation shall update Status.State for the resource, once the modify operation completes.

8.9.4 Actions

Swordfish supports the approach to Actions in the *Redfish Specification*:

Actions are Redfish operations that do not easily map to RESTful interface semantics. These types of operations may not directly affect properties in the Redfish Resources.

Swordfish refines the requirements in the *Redfish Specification*: Services shall support the POST method to send actions to Resources.

If a Task Service has been implemented, the Redfish service shall return a status code of 202, with the Location header set to the URI of the Task Monitor. Once the provider has returned a Task Monitor to the client, the Client can then query the provided task URI to track the task completion status. Once the task has completed successfully, a GET against the task monitor shall return the created object.

If a Task Service has not been implemented, the Redfish service shall return a status code of 200, and the body of the response shall contain the URI of the skeletal resource created as part of accepting the request. The client will be required to poll the URI provided to determine when the operation is complete. When processing ACTIONS, the handling of HTTP status codes is slightly different than that seen when processing CREATE or MODIFY requests. The HTTP status code is used to reflect the acceptance and formatting of the request. The outcome of any requested processing is reflected in the body of the returned message and its associated Error response structure. For example, a properly formatted request to execute a system reset may return an HTTP status code of 200 (OK), to reflect that the request has been received, was validly formatted, and has been accepted for processing, while the reset of the system may

not complete successfully. The Error response structure would contain further detail of the success of failure of the system reset. The implementation must check both the HTTP status code and the underlying Error response message structure to confirm the successful execution of the ACTION.

9 Swordfish type definitions

9.1 Overview

The following sections define the schema and type definitions that make up a Swordfish implementation. Each data type or entity within the schema includes a description that defines its implementation requirements and their interaction.

9.2 Introduction

9.3 Universal properties

The properties summarized in Table 10 are defined for inclusion in every Redfish schema, and therefore may be encountered in any response payload. They are documented here to avoid repetition in the property tables. Note that several of these properties are payload annotations, but appear here because they are required for all Redfish and Swordfish Resources.

9.3.0.1 Properties

Pro		Attri	
perty	Туре	butes	Notes

@od ata.t ype	s tring	read -only requ ired	The value of this property shall be a URI fragment that specifies the type of the resource and it shall be of the form defined in the Redfish specification.
Des cript ion	s tring	r ead-w rite	This property shall contain the description of this resource. The value shall conform with the 'Description' clause of the Redfish Specification.
• *Id	s tring **	r ead-w rite	This property shall contain the identifier for this resource. The value shall conform with the 'Id' clause of the Redfish Specification.
N ame	s tring	• wri req ired	This property shall contain the name of this d-resource or array member. The value shall conform with the 'Name' clause of the Redfish teSpecification. Ju d*
Oem {}	o bject		The manufacturer- or provider-specific extension moniker that divides the Oem object into sections.

9.4 Frequently used properties

In addition, the properties summarized in Table 11 are frequently defined in Redfish schemas. Their definition and usage is the same throughout the Redfish data model.

9.4.0.1 Properties

Pro perty	Туре	Attri butes	Notes
*Ac ons {}	o bject ti **		The Redfish actions available for this Resource.
Li nks {}	o bject		The links associated with the Resource, as defined by that Resource's schema definition. All associated reference properties defined for a Resource are nested under the Links property. Find all directly referenced, or subordinate, Resource properties from the root of the Resource.
Rel atedl tem [{	array		An array of links. Each link points to a Resource or part of a Resource as defined by that Resource's schema. This representation is not intended to be a strong linking methodology like other references. Instead, it shows a relationship between elements or subelements in disparate parts of the service. For example, fans might be in one area of the system and processors in another. The relationship between the two might not be obvious. This property can show that one is related to the other. In this example, it might indicate that a specific fan cools a specific processor.
@ odata .id	s tring (URI)	• rea onl	The value of this property shall be the unique d-identifier for the resource and it shall be of the form defined in the Redfish specification. y [*]

9.5.3.3 Property details

9.5.3.3.1 DurableNameFormat: The defined property values are listed in Table 15. This property shall represent the format of the DurableName property.

string	Description
EUI	This durable name shall contain the hexadecimal
	representation of the IEEE-defined 64-bit Extended Unique
	Identifier (EUI), as defined in the IEEE's Guidelines for 64-bit
	Global Identifier (EUI-64) Specification. The DurableName
	$f^{(0,0,0,0)}$
	([0-3A-Fa-I][2][-]][1]([0-3A-Fa-I][2][-]][1][0-3A-Fa-I][2][-][2][-]][2][-]][2][-]][2][-]][2][-]][2][-]][2][-]][2][-]][2][-]][2][-]][2][-][2][-]][2][-]][2][-]][2][-]][2][-][2][-]][2][-][2][-]][2][-][2][-]][2][-][2][-][2][-]][2][-][-][2][-][
	WideName(WWN) format as defined in the T11 Fibre Channel Physical and Sign
	9A - Fa - f[2[:-])7([0 - 9A - Fa - f]2)], where the most
	significant octet is first.
iON	This durable name shall be in the iSCSI Oualified Name (iON)
	format, as defined in RFC3720 and RFC3721.
MACAddress	This durable name shall be a media access control address
(v1.14+)	(MAC address), which is a unique identifier assigned to a
	network interface controller (NIC) for use as a network
	address. This value should not be used if a more specific type
	of identifier is available. The DurableName property shall
	follow the regular expression pattern '^([0-9A-Fa-f]{2}[:-]){5}(
	[0-9A-Fa-
	${\it f]{2}}', where the most significant octet is first. NAA This durable name shall contain the state of the state of$
	Framing and Signaling - 3(FC - FS -
	3) specification. The Durable Name property shall follow the regular expression path of the the second state of the the test of
	9A - Fa - f]2)8)1,2', where the most significant octet is
	first.
NGUID <i>(v1.10+)</i>	This durable name shall be in the Namespace Globally
	Unique Identifier (NGUID), as defined in the NVN Express
	Specification. The DurableName property shall follow the
	regular expression pattern '^([0-9A-Fa-f]{2}){16}\$', where the
	most significant octet is first.

 Table 15: DurableNameFormat property values

string	Description
NQN <i>(v1.6+)</i>	This durable name shall be in the NVMe Qualified Name (NQN) format, as defined in the NVN Express over Fabric Specification.
NSID (v1.6+, deprecated v1.12)	This durable name shall be in the NVM Namespace Identifier (NSID) format, as defined in the NVN Express Specification. Deprecated in v1.12 and later. This value has been deprecated due to its non-uniqueness and NGUID should be used.
UUID	This durable name shall contain the hexadecimal representation of the UUID, as defined by RFC4122. The DurableName property shall follow the regular expression pattern '([0-9a-fA-F]{8}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{12})'.

9.5.4 IOStatistics

9.5.4.1 Description The properties of this type shall be used to represent the IO statistics of the requested object.

9.5.4.2 Properties The properties defined for the IOStatistics schema are summarized in Table 16.

9.5.7.3 Property details

9.5.7.3.1 LocationType: The defined property values are listed in Table 21. This property shall contain the type of location of the part.

string	Description
Backplane (v1.12+)	This value shall indicate the part is a backplane in an enclosure.
Вау	This value shall indicate the part is located in a bay.
Connector	This value shall indicate the part is located in a connector or port.
Embedded <i>(v1.13+)</i>	This value shall indicate the part is embedded or otherwise permanently incorporated into a larger part or device. This value shall not be used for parts that can be removed by a user or are considered field-replaceable.
Slot	This value shall indicate the part is located in a slot.
Socket	This value shall indicate the part is located in a socket.

Table 21: LocationType property values ##### Orientation:

The defined property values are listed in Table 22. This property shall contain the orientation for the ordering used by the LocationOrdinalValue property.

Table 22: Orientation property values ##### RackOffsetUnits:

string	Description
BackToFront	This value shall indicate the ordering for LocationOrdinalValue is back to front.
BottomToTop	This value shall indicate the ordering for LocationOrdinalValue is bottom to top.
FrontToBack	This value shall indicate the ordering for LocationOrdinalValue is front to back.
LeftToRight	This value shall indicate the ordering for LocationOrdinalValue is left to right.
RightToLeft	This value shall indicate the ordering for LocationOrdinalValue is right to left.

string	Description
TopToBottom	This value shall indicate the ordering for LocationOrdinalValue is top to bottom.

The defined property values are listed in Table 23. This property shall contain a Rack-Unit enumeration literal that indicates the type of rack units in use.

Table 23: RackOffsetUnits property values ##### Reference:

string	Description
EIA_310	Rack units shall conform to the EIA-310 standard.
OpenU	Rack units shall be specified in terms of the Open Compute Open Rack Specification.

The defined property values are listed in Table 24. This property shall contain the general location within the unit of the part.

string	Description
Bottom	This value shall indicate the part is in the bottom of the unit.
Front	This value shall indicate the part is in the front of the unit.
Left	This value shall indicate the part is on the left side of of the unit.
Middle	This value shall indicate the part is in the middle of the unit.
Rear	This value shall indicate the part is in the rear of the unit.
Right	This value shall indicate the part is on the right side of the unit.
Тор	This value shall indicate the part is in the top of the unit.

9.5.8 Oem

9.5.8.1 Description This object represents the OEM properties. The resource values shall comply with the Redfish Specification-described requirements.

9.5.8.2 Properties The properties defined for the Oem schema are summarized in Table 25.

9.5.9.3 Property details

9.5.9.3.1 ConsistencyState: The defined property values are listed in Table 27. The ConsistencyState enumeration literal shall indicate the current state of consistency.

 Table 27: ConsistencyState property values ##### ConsistencyStatus:

string	Description
Consistent	This enumeration literal shall indicate that the source and target shall be consistent.
Inconsistent	This enumeration literal shall indicate that the source and target are not required to be consistent.

The defined property values are listed in Table 28. The ConsistencyStatus enumeration literal shall specify the current status of consistency. Consistency may have been disabled or is experiencing an error condition.

 Table 28: ConsistencyStatus property values ##### ConsistencyType:

string	Description
Consistent	This enumeration literal shall indicate that the source and
	target are consistent.

string	Description
Disabled	This enumeration literal shall indicate that the source and target have consistency disabled.
InError	This enumeration literal shall indicate that the source and target are not consistent.
InProgress	This enumeration literal shall indicate that the source and target are becoming consistent.

The defined property values are listed in Table 29. The ConsistencyType enumeration literal shall indicate the consistency type used by the source and its associated target group.

string	Description
Sequentia IlyConsistent	This enumeration literal shall indicate that the source and target shall be sequentially consistent.

The defined property values are listed in Table 30. The ReplicaFaultDomain enumeration literal shall describe the fault domain (local or remote) of the replica relationship.

Table 30: ReplicaFaultDomain property values ##### ReplicaPriority:

string	Description
Local	This enumeration literal shall indicate that the source and target replicas are contained within a single fault domain.
Remote	This enumeration literal shall indicate that the source and target replicas are in separate fault domains.

The defined property values are listed in Table 31. The enumeration literal shall specify the priority of background copy engine I/O to be managed relative to host I/O operations during a sequential background copy operation.

string	Description
High	Copy engine I/O shall have a higher priority than host I/O.
Low	Copy engine I/O shall have a lower priority than host I/O.
Same	Copy engine I/O shall have the same priority as host I/O.
Urgent	Regardless of the host I/O requests, the Copy operation shall be performed as soon as possible.

Table 31: ReplicaPriority property values ##### ReplicaProgressStatus:

The defined property values are listed in Table 32. The ReplicaProgressStatus enumeration literal shall specify the status of the session with respect to Replication activity.

string	Description
Aborting	This enumeration literal shall indicate that replication has an abort in progress.
Completed	This enumeration literal shall indicate that the request is completed. Data flow is idle.
Detaching	This enumeration literal shall indicate that replication has a detach in progress.
Dormant	This enumeration literal shall indicate that the data flow is inactive, suspended or quiesced.
FailingBack	This enumeration literal shall indicate that replication is undoing the result of failover.
FailingOver	This enumeration literal shall indicate that replication is in the process of switching source and target.
Fracturing	This enumeration literal shall indicate that replication has a fracture in progress.
Initializing	This enumeration literal shall indicate that replication is in the process of establishing source/replica relationship and the data flow has not started.

Table 32: ReplicaProgressStatus property values ##### ReplicaReadOnlyAccess:

string	Description
Mixed	This enumeration literal shall indicate that replication status is mixed across element pairs in a replication group. Generally, the individual statuses need to be examined.
Pending	This enumeration literal shall indicate that the flow of data has stopped momentarily due to limited bandwidth or a busy system.
Preparing	This enumeration literal shall indicate that replication has preparation in progress.
Req uiresActivate	This enumeration literal shall indicate that the requested operation has completed, however, the synchronization relationship needs to be activated before further copy operations can be issued.
R equiresDetach	This enumeration literal shall indicate that the requested operation has completed, however, the synchronization relationship needs to be detached before further copy operations can be issued.
Req uiresFracture	This enumeration literal shall indicate that the requested operation has completed, however, the synchronization relationship needs to be fractured before further copy operations can be issued.
R equiresResume	This enumeration literal shall indicate that the requested operation has completed, however, the synchronization relationship needs to be resumed before further copy operations can be issued.
R equiresResync	This enumeration literal shall indicate that the requested operation has completed, however, the synchronization relationship needs to be resynced before further copy operations can be issued.
RequiresSplit	This enumeration literal shall indicate that the requested operation has completed, however, the synchronization relationship needs to be split before further copy operations can be issued.
Restoring	This enumeration literal shall indicate that replication has a restore in progress.

string	Description
Resyncing	This enumeration literal shall indicate that replication has resynchronization in progress.
Splitting	This enumeration literal shall indicate that replication has a split in progress.
Suspending	This enumeration literal shall indicate that replication has a copy operation in the process of being suspended.
Synchronizing	This enumeration literal shall indicate that replication has synchronization in progress.
Terminating	This enumeration literal shall indicate that the replication relationship is in the process of terminating.

The defined property values are listed in Table 33. The enumeration literal shall specify whether the source, the target, or both elements are read only to the host.

 Table 33:
 ReplicaReadOnlyAccess property values ##### ReplicaRecoveryMode:

string	Description
Both	Both the source and the target elements shall be read only to the host.
R eplicaElement	The replica element shall be read-only to the host.
SourceElement	The source element shall be read-only to the host.

The defined property values are listed in Table 34. The enumeration literal shall specify whether the copy operation continues after a broken link is restored.

 Table 34:
 ReplicaRecoveryMode property values ##### ReplicaRole:

string	Description
Automatic	The copy operation shall resume automatically.

string	Description
Manual	The ReplicaState shall be set to Suspended after the link is restored. It is required to issue the Resume operation to continue.

The defined property values are listed in Table 35. The ReplicaRole enumeration literal shall represent the source or target role of this replica as known to the containing resource.

Table 35: ReplicaRole property values ##### ReplicaState:

string	Description
Source	This enumeration literal shall indicate a source element.
Target	This enumeration literal shall indicate target element.

The defined property values are listed in Table 36. The ReplicaState enumeration literal shall specify the state of the relationship with respect to Replication activity.

string	Description
Aborted	This enumeration literal shall indicate that the copy operation is aborted with the Abort operation. The Resync Replica operation can be used to restart the copy operation.
Broken	This enumeration literal shall indicate that the relationship is non-functional due to errors in the source, the target, the path between the two or space constraints.
Failedover	This enumeration literal shall indicate that the reads and writes are sent to the target element. The source element may not be reachable.
Fractured	This enumeration literal shall indicate that the Target is split from the source. The target may not be consistent.

Table 36: ReplicaState property values ##### ReplicaType:

string	Description
Inactive	This enumeration literal shall indicate that data flow has stopped, writes to source element shall not be sent to target element.
Initialized	This enumeration literal shall indicate that the link to enable replication is established and source/replica elements are associated, but the data flow has not started.
Invalid	This enumeration literal shall indicate that the storage server is unable to determine the state of the replication relationship, for example, after the connection is restored; however, either source or target elements have an unknown status.
Mixed	This enumeration literal shall indicate the ReplicaState of GroupSynchronized. The value indicates the StorageSynchronized relationships of the elements in the group have different ReplicaState values.
Partitioned	This enumeration literal shall indicate that the state of replication relationship can not be determined, for example, due to a connection problem.
Prepared	This enumeration literal shall indicate that initialization is completed, however, the data flow has not started.
Restored	This enumeration literal shall indicate that the source element was restored from the target element.
Skewed	This enumeration literal shall indicate that the target has been modified and is no longer synchronized with the source element or the point-in-time view.
Split	This enumeration literal shall indicate that the target element was gracefully (or systematically) split from its source element – consistency shall be guaranteed.
Suspended	This enumeration literal shall indicate that the data flow between the source and target elements has stopped. Writes to source element shall be held until the relationship is Resumed.

string	Description
Synchronized	This enumeration literal shall indicate that for Mirror, Snapshot, or Clone replication, the target represents a copy of the source.
U nsynchronized	This enumeration literal shall indicate that not all the source element data has been copied to the target element.

The defined property values are listed in Table 37. The ReplicaType enumeration literal shall describe the intended outcome of the replication.

string	Description
Clone	This enumeration literal shall indicate that replication shall create a point in time, full copy the source.
Mirror	This enumeration literal shall indicate that replication shall create and maintain a copy of the source.
Snapshot	This enumeration literal shall indicate that replication shall create a point in time, virtual copy of the source.
T okenizedClone	This enumeration literal shall indicate that replication shall create a token based clone.

Table 37: ReplicaType property values ##### ReplicaUpdateMode:

The defined property values are listed in Table 38. The enumeration literal shall specify whether the target elements will be updated synchronously or asynchronously.

string	Description
Active	This enumeration literal shall indicate Active-Active (i.e. bidirectional) synchronous updates.
Adaptive	This enumeration literal shall indicate that an implementation may switch between synchronous and asynchronous modes.

 Table 38: ReplicaUpdateMode property values ##### RequestedReplicaState:

string	Description
Asynchronous	This enumeration literal shall indicate Asynchronous updates.
Synchronous	This enumeration literal shall indicate Synchronous updates.

The defined property values are listed in Table 39. The last requested or desired state for the relationship. The actual state of the relationship shall be represented by ReplicaState. When RequestedState reaches the requested state, this property shall be null.

string	Description
Aborted	This enumeration literal shall indicate that the copy operation is aborted with the Abort operation. The Resync Replica operation can be used to restart the copy operation.
Broken	This enumeration literal shall indicate that the relationship is non-functional due to errors in the source, the target, the path between the two or space constraints.
Failedover	This enumeration literal shall indicate that the reads and writes are sent to the target element. The source element may not be reachable.
Fractured	This enumeration literal shall indicate that the Target is split from the source. The target may not be consistent.
Inactive	This enumeration literal shall indicate that data flow has stopped, writes to source element shall not be sent to target element.
Initialized	This enumeration literal shall indicate that the link to enable replication is established and source/replica elements are associated, but the data flow has not started.
Invalid	This enumeration literal shall indicate that the storage server is unable to determine the state of the replication relationship, for example, after the connection is restored; however, either source or target elements have an unknown status.

Table 39: Requested Replica State property values ##### Undiscovered Element:
string	Description
Mixed	This enumeration literal shall indicate the ReplicaState of GroupSynchronized. The value indicates the StorageSynchronized relationships of the elements in the group have different ReplicaState values.
Partitioned	This enumeration literal shall indicate that the state of replication relationship can not be determined, for example, due to a connection problem.
Prepared	This enumeration literal shall indicate that initialization is completed, however, the data flow has not started.
Restored	This enumeration literal shall indicate that the source element was restored from the target element.
Skewed	This enumeration literal shall indicate that the target has been modified and is no longer synchronized with the source element or the point-in-time view.
Split	This enumeration literal shall indicate that the target element was gracefully (or systematically) split from its source element – consistency shall be guaranteed.
Suspended	This enumeration literal shall indicate that the data flow between the source and target elements has stopped. Writes to source element shall be held until the relationship is Resumed.
Synchronized	This enumeration literal shall indicate that for Mirror, Snapshot, or Clone replication, the target represents a copy of the source.
U nsynchronized	This enumeration literal shall indicate that not all the source element data has been copied to the target element.

The defined property values are listed in Table 40. The enumeration literal shall specify whether the source, the target, or both elements involved in a copy operation are undiscovered. An element is considered undiscovered if its object model is not known to the service performing the copy operation.

Table 40: UndiscoveredElement property values

string	Description
R eplicaElement	This enumeration literal shall indicate that the replica element is undiscovered.
SourceElement	This enumeration literal shall indicate that the source element is undiscovered.

9.5.10 ReplicaRequest

9.5.10.1 Description A ReplicaRequest shall contain information about the ReplicaSource and the ReplicaName.

9.5.10.2 Properties The properties defined for the ReplicaRequest schema are summarized in Table 41.

The defined property values are listed in Table 49. This property shall indicate whether and why this component is available. Enabled indicates the resource is available. Disabled indicates the resource has been intentionally made unavailable but it can be enabled. Offline indicates the resource is unavailable intentionally and requires action to make it available. InTest indicates that the component is undergoing testing. Starting indicates that the resource is becoming available. Absent indicates the resource is physically unavailable.

Table 49: State property values

string	Description
Absent	This function or resource is either not present or detected.

string	Description
Deferring (v1.2+)	The element does not process any commands but queues new requests.
Disabled	This function or resource is disabled.
Enabled	This function or resource is enabled.
InTest	This function or resource is undergoing testing, or is in the process of capturing information for debugging.
Qualified (v1.9+)	The element quality is within the acceptable range of operation.
Quiesced (v1.2+)	The element is enabled but only processes a restricted set of commands.
S tandbyOffline	This function or resource is enabled but awaits an external action to activate it.
StandbySpare	This function or resource is part of a redundancy set and awaits a failover or other external action to activate it.
Starting	This function or resource is starting.
Unava ilableOffline (v1.1+)	This function or resource is present but cannot be used.
Updating (v1.2+)	The element is updating and might be unavailable or degraded.

9.6 Swordfish Schema Types

9.6.1 CapacitySource 1.2.0

9.6.1.1 Description This composition may be used to represent the source and type of storage capacity. At most one of the ProvidingDrives, ProvidingVolumes, ProvidingMemoryChunks, ProvidingMemory or ProvidingPools properties may have a value. If any of ProvidingDrives, ProvidingVolumes, ProvidingMemory or Providing-Pools reference more than one resource, allocation of capacity across those resources is implementation dependent.

9.6.1.2 URIs /redfish/v1/Storage/{Storageld}/FileSystems/{FileSystem/d}/CapacitySources/{CapacitySourceld} /redfish/v1/Storage/{StoragePools/ {StoragePoolId}/CapacitySources/{CapacitySourceld} /redfish/v1/Storage/{Storage}/Volumes/{Volumeld}/CapacitySources/{CapacitySourceld} /redfish/v1/ StorageServices/{StorageServiceld}/FileSystems/{FileSystemId}/CapacitySources/ {CapacitySourceld} /redfish/v1/StorageServices/{StorageServiceld}/StoragePools/ {StoragePoolId}/CapacitySources/{CapacitySourceld} /redfish/v1/ StoragePoolId}/CapacitySources/{CapacitySourceld} /redfish/v1/StoragePools/ {StoragePoolId}/CapacitySources/{CapacitySourceld} /redfish/v1/ StorageServiceld}/Volumes/{Volumeld}/CapacitySources/{CapacitySourceld} /redfish/ v1/Systems/{ComputerSystemId}/Storage/{StorageId}/FileSystems/{FileSystemId}/ CapacitySources/{CapacitySourceld} /redfish/v1/Systems/{ComputerSystemId}/Storage/{StorageId}/StoragePools/{StoragePoolId}/CapacitySources/{CapacitySourceld} /redfish/v1/Systems/{ComputerSystemId}/Storage/{StorageId}/Volumes/{Volumeld}/ CapacitySources/{CapacitySourceld}

9.6.5.4 Actions

9.6.5.4.1 AssignReplicaTarget Description

This action shall be used to establish a replication relationship by assigning an existing consistency group to serve as a target replica for an existing source consistency group.

$Action \, URI: \{Base \, URI \, of \, target \, resource\} / Actions / Consistency Group. Assign Replica Target \, and \,$

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.5.4.1. | Parameter Name | Type | Attributes | Notes | | :-- | :-- | :-- -- -- || **ReplicaType** | string (enum) | *required* | This parameter shall contain the type of replica relationship to be created. *For the possible property values, see ReplicaType in Property details.* || **ReplicaUpdateMode** | string (enum) | *required* | This parameter shall specify the replica update mode. *For the possible property values, see ReplicaUpdateMode in Property details.* || **TargetConsistencyGroup** | string | *required* | This parameter shall contain the Uri to the existing consistency group. | Table: AssignReplicaTarget action parameters

9.6.5.4.2 CreateReplicaTarget Description

This action shall be used to create a new consistency group resource to provide expanded data protection through a replica relationship with the specified source consistency group.

Action URI: {Base URI of target resource}/Actions/ConsistencyGroup.CreateReplicaTarget

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.5.4.2. | Parameter Name | Type | Attributes | Notes | | :-- | :-- | :-- | :-- --- || **ConsistencyGroupName** | string | *required* | This parameter shall contain the Name for the target consistency group. || **ReplicaType** | string (enum) | *required* | This parameter shall contain the type of replica relationship to be created. *For the possible property values, see ReplicaType in Property details.* || **ReplicaUpdateMode** | string (enum) | *required* | This parameter shall specify the replica update mode. *For the possible property values, see ReplicaUpdateMode in Property details.* || **TargetStoragePool** | string | *required* | This parameter shall contain the Uri to the existing StoragePool in which to create the target consistency group. | Table: CreateReplicaTarget action parameters

9.6.5.4.3 RemoveReplicaRelationship Description

This action shall be used to disable data synchronization between a source and target consistency group, remove the replication relationship, and optionally delete the target consistency group.

Action URI: {Base URI of target resource}/Actions/ConsistencyGroup.RemoveReplicaRelationship

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.5.4.3. | Parameter Name | Type | Attributes | Notes | | :-- | :-- | :-- | :-- | | **DeleteTarget**-**ConsistencyGroup** | boolean | *optional* | This parameter shall indicate whether or not to delete the target consistency group as part of the operation. If not specified, the system should use its default behavior. || **TargetConsistencyGroup** | string | *required* | This parameter shall contain the Uri to the existing target consistency group. | Table: RemoveReplicaRelationship action parameters

9.6.5.4.4 ResumeReplication Description

This action shall be used to resume the active data synchronization between a source and target consistency group, without otherwise altering the replication relationship.

Action URI: {Base URI of target resource}/Actions/ConsistencyGroup.ResumeReplication

Action parameters

9.6.5.4.5 ReverseReplicationRelationship Description

This action shall be used to reverse the replication relationship between a source and target consistency group.

Action URI: {Base URI of target resource}/Actions/ConsistencyGroup.ReverseReplicationRelationship

Action parameters

9.6.5.4.6 SplitReplication Description

This action shall be used to split the replication relationship and suspend data synchronization between a source and target consistency group.

Action URI: {Base URI of target resource}/Actions/ConsistencyGroup.SplitReplication

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.5.4.6. | Parameter Name | Type | Attributes | Notes | |:- |:- |:- |:- ----- || **TargetConsistencyGroup** | string | *required* | This parameter shall contain the Uri to the existing target consistency group. | Table: SplitReplication action parameters

9.6.5.4.7 SuspendReplication Description

This action shall be used to suspend active data synchronization between a source and target consistency group, without otherwise altering the replication relationship.

$Action \, URI: \{Base \, URI \, of \, target \, resource\} / Actions / Consistency Group. \\ Suspend Replication$

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.5.4.7. | Parameter Name | Type | Attributes | Notes | |:- |:- |:- |:- -- || **TargetConsistencyGroup** | string | *required* | This parameter shall contain the Uri to the existing target consistency group. | Table: SuspendReplication action parameters

9.6.5.5 Property details

9.6.5.5.1 ConsistencyMethod: The defined property values are listed in Table 55. The property shall set the consistency method used by this group.

string	Description
HotStandby	Supports consistency method commonly orchestrated using application-specific code.
Other	Supports consistency method orchestrated using vendor-specific code.
VASA	Supports VMware consistency requirements, such as for VASA and VVOLs.
VDI	Supports Microsoft virtual backup device interface (VDI).
VSS	Supports Microsoft VSS.

 Table 55: ConsistencyMethod property values ##### ConsistencyType:

The defined property values are listed in Table 56. This property shall set the consistency type used by this group. **Table 56:** ConsistencyType property values ##### ReplicaType:

string	Description
Applicat ionConsistent	Orchestration exists to either flush or halt pending IO to ensure operations occur in a transactionally consistent
Cr ashConsistent	manner. Requested operations are either triggered or instituted without regard to pending IO.

The defined property values are listed in Table 57. This parameter shall contain the type of replica relationship to be created.

string	Description
Clone	This enumeration literal shall indicate that replication shall create a point in time, full copy the source.
Mirror	This enumeration literal shall indicate that replication shall create and maintain a copy of the source.
Snapshot	This enumeration literal shall indicate that replication shall create a point in time, virtual copy of the source.
T okenizedClone	This enumeration literal shall indicate that replication shall create a token based clone.

Table 57: ReplicaType property values ##### ReplicaUpdateMode:

The defined property values are listed in Table 58. This parameter shall specify the replica update mode.

Table 58: ReplicaUpdateMode property values

string	Description
Active	This enumeration literal shall indicate Active-Active
	(i.e. bidirectional) synchronous updates.

string	Description
Adaptive	This enumeration literal shall indicate that an implementation may switch between synchronous and asynchronous modes.
Asynchronous	This enumeration literal shall indicate Asynchronous updates.
Synchronous	This enumeration literal shall indicate Synchronous updates.

9.6.6 ConsistencyGroupCollection

9.6.6.1 URIs /redfish/v1/Storage/{*StorageId*}/ConsistencyGroups /redfish/v1/StorageServices/{*StorageServiceId*}/ConsistencyGroups /redfish/v1/StorageServices/{*StorageServiceId*}/Volumes/{*VolumeId*}/ConsistencyGroups /redfish/v1/Systems/{*ComputerSystemId*}/Storage/{*StorageId*}/ConsistencyGroups

9.6.6.2 Properties The properties defined for the ConsistencyGroupCollection schema are summarized in Table 59.

Pro		Attri	
perty	Туре	butes	Notes
Des cript ion	s tring	read -only (n ull)	This property shall contain the description of this resource. The value shall conform with the 'Description' clause of the Redfish Specification.

9.6.7.4 Actions

9.6.7.4.1 CreateReplicas Description

This action shall create an on-demand replica that conforms to the bound DataProtectionLineOfService.

Action URI: {Base URI of target resource}/Actions/DataProtectionLineOfService.CreateReplicas

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.7.4.1. | Parameter Name |Type | Attributes | Notes | |:- |:- |:- |:- ----- || **ReplicaLineOfService** { | object | *required* | The value shall reference the data protection line of service this operation is bound to. || **@odata.id** | string | *read-only* | Link to another DataProtectionLineOfService resource. || }|||| **ReplicaRequests** [{ | array | optional | Each value shall reference a source resource and provide a name for the **ReplicaName** (v1.1+) | string | read-write (null) | The value shall be replica. || the names of the replica. || **ReplicaSource** (v1.1+) { | object | | The value shall reference a resource to be replicated. **@odata.id** | string (URI) | read-only | The value of this property shall be the unique identifier for the resource and it shall be of the form defined in the Redfish specification. }]||| Table: }|||| CreateReplicas action parameters

9.6.7.5 Property details

9.6.7.5.1 RecoveryGeographicObjective: The defined property values are listed in Table 61. The value specifies the geographic scope of the failure domain.

Table 61: RecoveryGeographicObjective property values #####RecoveryTimeObjective:

string	Description
Datacenter	A facility that provides communication, power, or cooling infrastructure to a co-located set of servers, networking and storage.
Rack	A container within a datacenter that provides communication, power, or cooling to a set of components.
RackGroup	A set of racks that may share common communication, power, or cooling.
Region	A set of resources that are required to be either geographically or politically isolated from resources not in the resources.
Row	A set of adjacent racks or rackgroups that may share common communication, power, or cooling.
Server	Components of a CPU/memory complex that share the same infrastructure.

The defined property values are listed in Table 62. The value shall be an enumeration that indicates the maximum time required to access an alternate replica. In the case that IsIsolated = false, failure of the domain is not a consideration.

Table 62: RecoveryTimeObjective property values ##### ReplicaType:

string	Description
Nearline	Access to a replica shall be consistent with switching access to
	a different path through a different front-end interconnection
	infrastructure. Some inconsistency may occur. A restore step
	may be required before recovery can commence.

string	Description
Offline	Access to a replica may take a significant amount of time. No direct connection to the replica is assumed. Some inconsistency loss may occur. A restore step is likely to be required.
OnlineActive	Access to synchronous replicas shall be instantaneous.
OnlinePassive	Access to a synchronous replica shall be consistent with switching access to a different path the same front-end interconnect. A restore step shall not be required.

The defined property values are listed in Table 63. The type of replica shall conform to this value.

Table 63: ReplicaType property values

string	Description
Clone	This enumeration literal shall indicate that replication shall create a point in time, full copy the source.
Mirror	This enumeration literal shall indicate that replication shall create and maintain a copy of the source.
Snapshot	This enumeration literal shall indicate that replication shall create a point in time, virtual copy of the source.
T okenizedClone	This enumeration literal shall indicate that replication shall create a token based clone.

9.6.8 DataProtectionLoSCapabilities 1.2.0

9.6.8.1 Description The capabilities to protect data from loss by the use of a replica. The requirements shall be met collectively by the communication path and the replica. There should be one instance associated to a class of service for each replica. Each replica independently should have a class of service that describes its characteristics.

9.6.8.2 URIs /redfish/v1/StorageServices/{*StorageServiceId*}/DataProtection-LoSCapabilities

9.6.8.3 Properties The properties defined for the DataProtectionLoSCapabilities 1.2.0 schema are summarized in Table 64.

9.6.9.4 Property details

9.6.9.4.1 AntivirusScanPolicies: The defined property values are listed in Table 69. The enumeration literal shall specify the policy for triggering an AntiVirus scan.

string	Description
None	This enumeration literal specifies No trigger.
OnFirstRead	This enumeration literal specifies to trigger on first read.
On PatternUpdate	This enumeration literal specifies to trigger on antivirus pattern file update.
OnRename	This enumeration literal specifies to trigger on object rename.
OnUpdate	This enumeration literal specifies to trigger on object update.

Table 69: AntivirusScanPolicies property values ##### ChannelEncryptionStrength:

The defined property values are listed in Table 70. The enumeration literal shall specify a key size in a symmetric encryption algorithm for transport channel encryption.

 Table 70:
 ChannelEncryptionStrength property values ##### DataSanitizationPolicy:

string	Description
Bits_0	This enumeration literal specifies that there is no key.
Bits_112	This enumeration literal specifies a 3DES 112 bit key.
Bits_128	This enumeration literal specifies an AES 128 bit key.
Bits_192	This enumeration literal specifies an AES 192 bit key.
Bits_256	This enumeration literal specifies an AES 256 bit key.

The defined property values are listed in Table 71. The enumeration literal shall specify the data sanitization policy.

Table 71: DataSanitizationPolicy property values ##### HostAuthenticationType:

string	Description
Clear	This enumeration literal specifies to sanitize data in all user-addressable storage locations for protection against simple non-invasive data recovery techniques

string	Description
Crypt ographicErase	This enumeration literal specifies to leverages the encryption of target data by enabling sanitization of the target data's encryption key. This leaves only the ciphertext remaining on the media, effectively sanitizing the data by preventing read-access. For more information, see NIST800-88 and ISO/IEC 27040.
None	This enumeration literal specifies no sanitization.

The defined property values are listed in Table 72. The enumeration literal shall specify the authentication type for hosts (servers) or initiator endpoints.

string	Description
None	This enumeration literal specifies No authentication.
Password	This enumeration literal specifies Password/shared-secret: Absent an distributed authentication infrastructure, this is what is typically done.
PKI	This enumeration literal specifies a Public Key Infrastructure. Customers with the highest assurance requirements roll PKI out to hosts and users (it is more common for hosts than users. User PKI-based authentication has significant operational complications and administrative overheads, e.g., smart cards may be involved.
Ticket	This enumeration literal specifies Ticket-based (e.g., Kerberos): This is the most common class of authentication infrastructure used in enterprises. Kerberos is the best known example, and Windows usage of that via Active Directory is so widely deployed as to be a de facto standard. In other areas (e.g., academia) there are comparable ticket-based systems.

Table 72: HostAuthenticationType property values ##### MediaEncryptionStrength:

The defined property values are listed in Table 73. The enumeration literal shall specify a key size in a symmetric encryption algorithm for media encryption.

Table 73: MediaEncryptionStrength property values ##### SecureChannelProtocol:

string	Description
Bits_0	This enumeration literal specifies that there is no key.
Bits_112	This enumeration literal specifies a 3DES 112 bit key.
Bits_128	This enumeration literal specifies an AES 128 bit key.
Bits_192	This enumeration literal specifies an AES 192 bit key.
Bits_256	This enumeration literal specifies an AES 256 bit key.

The defined property values are listed in Table 74. The enumeration literal shall specify the protocol that provide encrypted communication.

Table 74: SecureChannelProtocol property values ##### UserAuthenticationType
--

string	Description
IPsec	This enumeration literal specifies Internet Protocol Security (IPsec), as defined by IETF RFC 2401.
None	This enumeration literal specifies no encryption.
RPCSEC_GSS	This enumeration literal specifies RPC access to the Generic Security Services Application Programming Interface (GSS-API), as defined by IETF RPC 2203.
TLS	This enumeration literal specifies Transport Layer Security (TLS), as defined by IETF RFC 5246.

The defined property values are listed in Table 75. The enumeration literal shall specify the authentication type for users (or programs).

Table 75: UserAuthenticationType property values

string	Description
None	This enumeration literal specifies No authentication.

string	Description
Password	This enumeration literal specifies Password/shared-secret: Absent an distributed authentication infrastructure, this is what is typically done.
PKI	This enumeration literal specifies a Public Key Infrastructure. Customers with the highest assurance requirements roll PKI out to hosts and users (it is more common for hosts than users. User PKI-based authentication has significant operational complications and administrative overheads, e.g., smart cards may be involved.
Ticket	This enumeration literal specifies Ticket-based (e.g., Kerberos): This is the most common class of authentication infrastructure used in enterprises. Kerberos is the best known example, and Windows usage of that via Active Directory is so widely deployed as to be a de facto standard. In other areas (e.g., academia) there are comparable ticket-based systems.

9.6.10.4 Property details

9.6.10.4.1 SupportedAntivirusScanPolicies: The defined property values are listed in Table 77. The enumeration literal shall specify supported policies that trigger an AntiVirus scan.

Table 77: SupportedAntivirusScanPolicies property values #####SupportedChannelEncryptionStrengths:

string	Description
None	This enumeration literal specifies No trigger.
OnFirstRead	This enumeration literal specifies to trigger on first read.

string	Description
On PatternUpdate	This enumeration literal specifies to trigger on antivirus pattern file update.
OnRename	This enumeration literal specifies to trigger on object rename.
OnUpdate	This enumeration literal specifies to trigger on object update.

The defined property values are listed in Table 78. The enumeration literal shall specify supported key sizes in a symmetric encryption algorithm (AES) for transport channel encryption.

Table 78: SupportedChannelEncryptionStrengths property values #####SupportedDataSanitizationPolicies:

string	Description
Bits_0	This enumeration literal specifies that there is no key.
Bits_112	This enumeration literal specifies a 3DES 112 bit key.
Bits_128	This enumeration literal specifies an AES 128 bit key.
Bits_192	This enumeration literal specifies an AES 192 bit key.
Bits_256	This enumeration literal specifies an AES 256 bit key.

The defined property values are listed in Table 79. The enumeration literal shall specify supported data sanitization policies.

Table 79: SupportedDataSanitizationPolicies property values #####SupportedHostAuthenticationTypes:

string	Description
Clear	This enumeration literal specifies to sanitize data in all user-addressable storage locations for protection against
	simple non-invasive data recovery techniques.

string	Description
Crypt ographicErase	This enumeration literal specifies to leverages the encryption of target data by enabling sanitization of the target data's encryption key. This leaves only the ciphertext remaining on the media, effectively sanitizing the data by preventing read-access. For more information, see NIST800-88 and ISO/IEC 27040.
None	This enumeration literal specifies no sanitization.

The defined property values are listed in Table 80. The enumeration literal shall specify supported authentication types for hosts (servers) or initiator endpoints.

Table 80: SupportedHostAuthenticationTypes property values #####SupportedMediaEncryptionStrengths:

string	Description
None	This enumeration literal specifies No authentication.
Password	This enumeration literal specifies Password/shared-secret: Absent an distributed authentication infrastructure, this is what is typically done.
PKI	This enumeration literal specifies a Public Key Infrastructure. Customers with the highest assurance requirements roll PKI out to hosts and users (it is more common for hosts than users. User PKI-based authentication has significant operational complications and administrative overheads, e.g., smart cards may be involved.
Ticket	This enumeration literal specifies Ticket-based (e.g., Kerberos): This is the most common class of authentication infrastructure used in enterprises. Kerberos is the best known example, and Windows usage of that via Active Directory is so widely deployed as to be a de facto standard. In other areas (e.g., academia) there are comparable ticket-based systems.

The defined property values are listed in Table 81. The enumeration literal shall specify supported key sizes in a symmetric encryption algorithm (AES) for media encryption.

Table 81: SupportedMediaEncryptionStrengths property values #####SupportedSecureChannelProtocols:

string	Description
Bits_0	This enumeration literal specifies that there is no key.
Bits_112	This enumeration literal specifies a 3DES 112 bit key.
Bits_128	This enumeration literal specifies an AES 128 bit key.
Bits_192	This enumeration literal specifies an AES 192 bit key.
Bits_256	This enumeration literal specifies an AES 256 bit key.

The defined property values are listed in Table 82. The enumeration literal shall specify supported protocols that provide encrypted communication.

Table 82: SupportedSecureChannelProtocols property values #####SupportedUserAuthenticationTypes:

string	Description
IPsec	This enumeration literal specifies Internet Protocol Security (IPsec), as defined by IETF RFC 2401.
None	This enumeration literal specifies no encryption.
RPCSEC_GSS	This enumeration literal specifies RPC access to the Generic Security Services Application Programming Interface (GSS-API), as defined by IETF RPC 2203.
TLS	This enumeration literal specifies Transport Layer Security (TLS), as defined by IETF RFC 5246.

The defined property values are listed in Table 83. The enumeration literal shall specify supported authentication types for users (or programs).

string	Description
None	This enumeration literal specifies No authentication.
Password	This enumeration literal specifies Password/shared-secret: Absent an distributed authentication infrastructure, this is what is typically done.
PKI	This enumeration literal specifies a Public Key Infrastructure. Customers with the highest assurance requirements roll PKI out to hosts and users (it is more common for hosts than users. User PKI-based authentication has significant operational complications and administrative overheads, e.g., smart cards may be involved.
Ticket	This enumeration literal specifies Ticket-based (e.g., Kerberos): This is the most common class of authentication infrastructure used in enterprises. Kerberos is the best known example, and Windows usage of that via Active Directory is so widely deployed as to be a de facto standard. In other areas (e.g., academia) there are comparable ticket-based systems.

For the possible property values, see RecoveryTimeObjectives in Property details.

9.6.11.4 Property details

9.6.11.4.1 AccessCapabilities: The defined property values are listed in Table 85. Each entry specifies a required storage access capability.

string	Description
Append	This enumeration literal shall indicate that the storage may be written only to append.
Execute	This value shall indicate that Execute access is allowed by the file share.
Read	This enumeration literal shall indicate that the storage may be read.
Streaming	This enumeration literal shall indicate that the storage may be read sequentially.
Write	This enumeration literal shall indicate that the storage may be written multiple times.
WriteOnce	This enumeration literal shall indicate that the storage may be written only once.

Table 85: AccessCapabilities property values ##### ProvisioningPolicy:

The defined property values are listed in Table 86. The enumeration literal shall define the provisioning policy for storage.

Table 86: Provisioni	ngPolicy property v	alues ##### Recove	ryTimeObjectives:
----------------------	---------------------	--------------------	-------------------

string	Description
Fixed	This enumeration literal specifies storage shall be fully allocated.
Thin	This enumeration literal specifies storage may be over allocated.

The defined property values are listed in Table 87. The enumeration literal specifies the time after a disaster that the client shall regain conformant service level access to

the primary store, typical values are 'immediate' or 'offline'. The expectation is that the services required to implement this capability are part of the advertising system.

string	Description	
Nearline	Access to a replica shall be consistent with switching access a different path through a different front-end interconnection infrastructure. Some inconsistency may occur. A restore st may be required before recovery can commence.	
Offline	Access to a replica may take a significant amount of time. No direct connection to the replica is assumed. Some inconsistency loss may occur. A restore step is likely to be required.	
OnlineActive	Access to synchronous replicas shall be instantaneous.	
OnlinePassive	Access to a synchronous replica shall be consistent with switching access to a different path the same front-end interconnect. A restore step shall not be required.

9.6.14.4 Property details

9.6.14.4.1 DefaultAccessCapabilities: The defined property values are listed in Table 94. The value of this property shall be an array containing entries for the default access capabilities for the file share. Each entry shall specify a default access privilege.

The types of default access can include Read, Write, and/or Execute.

string	Description
Append	This enumeration literal shall indicate that the storage may be written only to append.
Execute	This value shall indicate that Execute access is allowed by the file share.
Read	This enumeration literal shall indicate that the storage may be read.
Streaming	This enumeration literal shall indicate that the storage may be read sequentially.
Write	This enumeration literal shall indicate that the storage may be written multiple times.
WriteOnce	This enumeration literal shall indicate that the storage may be written only once.

 Table 94:
 DefaultAccessCapabilities
 property
 values
 #####
 FileShareQuotaType:

The defined property values are listed in Table 95. If FileShareQuotaType is present, a value of Soft shall specify that quotas are not enforced, and a value of Hard shall specify that writes shall fail if the space consumed would exceed the value of the FileShareTotalQuotaBytes property.

 Table 95:
 FileShareQuotaType property values ##### FileSharingProtocols:

string	Description
Hard	This value shall indicate that quotas are enabled and enforced.
Soft	This value shall indicate that quotas are enabled but not enforced.

The defined property values are listed in Table 96. This property shall be an array containing entries for the file sharing protocols supported by this file share. Each entry shall specify a file sharing protocol supported by the file system.

string	Description
NFSv3	This value shall indicate that NFSv3, as defined in RFC 1813, is supported by the file system.
NFSv4_0	This value shall indicate that NFSv4, as defined in RFC 7530, is supported by the file system.
NFSv4_1	This value shall indicate that NFSv4.1, as defined in RFC 5661, is supported by the file system.
SMBv2_0	This value shall indicate that Server Message Block version 2.0 is supported by the file system.
SMBv2_1	This value shall indicate that Server Message Block version 2.1 is supported by the file system.
SMBv3_0	This value shall indicate that Server Message Block version 3.0 is supported by the file system.
SMBv3_0_2	This value shall indicate that Server Message Block version 3.0.2 is supported by the file system.
SMBv3_1_1	This value shall indicate that Server Message Block version 3.1.1 is supported by the file system.

Table 96: FileSharingProtocols property values ##### WritePolicy:

The defined property values are listed in Table 97. The value of this property shall define how writes are replicated to the shared source.

Table 97: WritePolicy property values

string	Description
Active	This enumeration literal shall indicate Active-Active (i.e. bidirectional) synchronous updates.
Adaptive	This enumeration literal shall indicate that an implementation may switch between synchronous and asynchronous modes.
Asynchronous	This enumeration literal shall indicate Asynchronous updates.
Synchronous	This enumeration literal shall indicate Synchronous updates.

9.6.16.4 Property details

9.6.16.4.1 AccessCapabilities: The defined property values are listed in Table 100. This property shall be an array containing entries for the supported IO access capabilities. Each entry shall specify a current storage access capability.

 Table 100: AccessCapabilities property values ##### CharacterCodeSet:

string	Description
Append	This enumeration literal shall indicate that the storage may be written only to append.
Execute	This value shall indicate that Execute access is allowed by the file share.
Read	This enumeration literal shall indicate that the storage may be read.
Streaming	This enumeration literal shall indicate that the storage may be read sequentially.
Write	This enumeration literal shall indicate that the storage may be written multiple times.
WriteOnce	This enumeration literal shall indicate that the storage may be written only once.

The defined property values are listed in Table 101. This property shall be an array containing entries for the character sets or encodings supported by the file system. Each entry shall specify a character set encoding supported by the file system.

string	Description
ASCII	This value shall indicate that the ASCII character encoding is supported by the file system.
Ext endedUNIXCode	This value shall indicate that Extended Unix Code character encoding is supported by the file system.
ISO2022	This value shall indicate that ISO-2022 character encoding is supported by the file system.
ISO8859_1	This value shall indicate that ISO-8859-1 character encoding is supported by the file system.
UCS_2	This value shall indicate that the UCS-2 character encoding is supported by the file system.
Unicode	This value shall indicate that Unicode character encoding is supported by the file system.
UTF_16	This value shall indicate that the UTF-16 character encoding is supported by the file system.
UTF_8	This value shall indicate that the UTF-8 character encoding is supported by the file system.

9.6.19.4.1 AccessProtocols: The defined property values are listed in Table 105. The Enumeration Literal shall specify the Access protocol for this service option. NOTE: If multiple protocols are specified, the corresponding MaxSupportedIOPS governs the

max achieved across all protocol uses. This may be less than the sum of the individual max values, which may be specified by individual Line of Service entries.

string	Description
AHCI	This value shall indicate conformance to the Intel Advanced Host Controller Interface (AHCI) Specification.
DisplayPort	This value shall indicate conformance to the VESA DisplayPort Specification.
DVI	This value shall indicate conformance to the Digital Display Working Group DVI-A, DVI-D, or DVI-I Specification.
Ethernet	This value shall indicate conformance to the IEEE 802.3 Ethernet specification.
FC	This value shall indicate conformance to the T11 Fibre Channel Physical and Signaling Interface Specification.
FCoE	This value shall indicate conformance to the T11 FC-BB-5 Specification.
FCP	This value shall indicate conformance to the INCITS 481: Information Technology - Fibre Channel Protocol for SCSI.
FICON	This value shall indicate conformance to the ANSI FC-SB-3 Single-Byte Command Code Sets-3 Mapping Protocol for the Fibre Channel (FC) protocol. Fibre Connection (FICON) is the IBM-proprietary name for this protocol.
FTP	This value shall indicate conformance to the RFC114-defined File Transfer Protocol (FTP).
GenZ	This value shall indicate conformance to the Gen-Z Core Specification.
HDMI	This value shall indicate conformance to the HDMI Forum HDMI Specification.
НТТР	This value shall indicate conformance to the Hypertext Transport Protocol (HTTP) as defined by RFC3010 or RFC5661.

Table 105: AccessProtocols property values

string	Description
HTTPS	This value shall indicate conformance to the Hypertext Transfer Protocol Secure (HTTPS) as defined by RFC2068 or RFC2616, which uses Transport Layer Security (TLS) as defined by RFC5246 or RFC6176.
I2C	This value shall indicate conformance to the NXP Semiconductors I2C-bus Specification.
InfiniBand	This value shall indicate conformance to the InfiniBand Architecture Specification-defined InfiniBand protocol.
iSCSI	This value shall indicate conformance to the IETF Internet Small Computer Systems Interface (iSCSI) Specification.
iWARP	This value shall indicate conformance to the RFC5042-defined Internet Wide Area RDMA Protocol (iWARP) that uses the transport layer mechanisms as defined by RFC5043 or RFC5044.
MultiProtocol	This value shall indicate conformance to multiple protocols.
NFSv3	This value shall indicate conformance to the RFC1813-defined Network File System (NFS) protocol.
NFSv4	
NVLink	This value shall indicate conformance to the NVIDIA NVLink protocol.
NVMe	This value shall indicate conformance to the Non-Volatile Memory Host Controller Interface Specification.
NV MeOverFabrics	This value shall indicate conformance to the NVM Express over Fabrics Specification.
OEM	This value shall indicate conformance to an OEM-specific architecture and the OEM section may include additional information.
PCIe	This value shall indicate conformance to the PCI-SIG PCI Express Base Specification.
RoCE	This value shall indicate conformance to the InfiniBand Architecture Specification-defined RDMA over Converged Ethernet Protocol.

string	Description
RoCEv2	This value shall indicate conformance to the InfiniBand Architecture Specification-defined RDMA over Converged Ethernet Protocol version 2.
SAS	This value shall indicate conformance to the T10 SAS Protocol Layer Specification.
SATA	This value shall indicate conformance to the Serial ATA International Organization Serial ATA Specification.
SFTP	This value shall indicate conformance to the RFC114-defined SSH File Transfer Protocol (SFTP) that uses Transport Layer Security (TLS) as defined by RFC5246 or RFC6176.
SMB	This value shall indicate conformance to the Server Message Block (SMB), or Common Internet File System (CIFS), protocol.
ТСР	This value shall indicate conformance to the IETF-defined Transmission Control Protocol (TCP). For example, RFC7414 defines the roadmap of the TCP specification.
TFTP	This value shall indicate conformance to the IETF-defined Trivial File Transfer Protocol (TFTP). For example, RFC1350 defines the core TFTP version 2 specification.
UDP	This value shall indicate conformance to the IETF-defined User Datagram Protocol (UDP). For example, RFC768 defines the core UDP specification.
UHCI	This value shall indicate conformance to the Intel Universal Host Controller Interface (UHCI) Specification, Enhanced Host Controller Interface Specification, or the Extensible Host Controller Interface Specification.
USB	This value shall indicate conformance to the USB Implementers Forum Universal Serial Bus Specification.
VGA	This value shall indicate conformance to the VESA SVGA Specification.

9.6.20 IOConnectivityLoSCapabilities 1.2.0

9.6.20.1 Description Each instance of IOConnectivityLoSCapabilities describes capabilities of the system to support various IO Connectivity service options.

9.6.20.4 Property details

9.6.20.4.1 SupportedAccessProtocols: The defined property values are listed in Table 107. Access protocols supported by this service option. NOTE: SMB+NFS* requires that SMB and at least one of NFSv3 or NFXv4 are also selected, (i.e. {'SMB', 'NFSv4', 'SMB+NFS*'}).

 Table 107: SupportedAccessProtocols property values

string	Description
AHCI	This value shall indicate conformance to the Intel Advanced Host Controller Interface (AHCI) Specification.
DisplayPort	This value shall indicate conformance to the VESA DisplayPort Specification.
DVI	This value shall indicate conformance to the Digital Display Working Group DVI-A, DVI-D, or DVI-I Specification.
Ethernet	This value shall indicate conformance to the IEEE 802.3 Ethernet specification.
FC	This value shall indicate conformance to the T11 Fibre Channel Physical and Signaling Interface Specification.
FCoE	This value shall indicate conformance to the T11 FC-BB-5 Specification.

string	Description		
FCP	This value shall indicate conformance to the INCITS 481: Information Technology - Fibre Channel Protocol for SCSI.		
FICON	This value shall indicate conformance to the ANSI FC-SB-3 Single-Byte Command Code Sets-3 Mapping Protocol for the Fibre Channel (FC) protocol. Fibre Connection (FICON) is the IBM-proprietary name for this protocol.		
FTP	This value shall indicate conformance to the RFC114-defined File Transfer Protocol (FTP).		
GenZ	This value shall indicate conformance to the Gen-Z Core Specification.		
HDMI	This value shall indicate conformance to the HDMI Forum HDMI Specification.		
НТТР	This value shall indicate conformance to the Hypertext Transport Protocol (HTTP) as defined by RFC3010 or RFC5661.		
HTTPS	This value shall indicate conformance to the Hypertext Transfer Protocol Secure (HTTPS) as defined by RFC2068 or RFC2616, which uses Transport Layer Security (TLS) as defined by RFC5246 or RFC6176.		
12C	This value shall indicate conformance to the NXP Semiconductors I2C-bus Specification.		
InfiniBand	This value shall indicate conformance to the InfiniBand Architecture Specification-defined InfiniBand protocol.		
iSCSI	This value shall indicate conformance to the IETF Internet Small Computer Systems Interface (iSCSI) Specification.		
iWARP	This value shall indicate conformance to the RFC5042-defined Internet Wide Area RDMA Protocol (iWARP) that uses the transport layer mechanisms as defined by RFC5043 or RFC5044.		
MultiProtocol	This value shall indicate conformance to multiple protocols.		
NFSv3	This value shall indicate conformance to the RFC1813-defined Network File System (NFS) protocol.		
NFSv4			

string	Description		
NVLink	This value shall indicate conformance to the NVIDIA NVLink protocol.		
NVMe	This value shall indicate conformance to the Non-Volatile Memory Host Controller Interface Specification.		
NV MeOverFabrics	This value shall indicate conformance to the NVM Express over Fabrics Specification.		
OEM	This value shall indicate conformance to an OEM-specific architecture and the OEM section may include additional information.		
PCIe	This value shall indicate conformance to the PCI-SIG PCI Express Base Specification.		
RoCE	This value shall indicate conformance to the InfiniBand Architecture Specification-defined RDMA over Converged Ethernet Protocol.		
RoCEv2	This value shall indicate conformance to the InfiniBand Architecture Specification-defined RDMA over Converged Ethernet Protocol version 2.		
SAS	This value shall indicate conformance to the T10 SAS Protocol Layer Specification.		
SATA	This value shall indicate conformance to the Serial ATA International Organization Serial ATA Specification.		
SFTP	This value shall indicate conformance to the RFC114-defined SSH File Transfer Protocol (SFTP) that uses Transport Layer Security (TLS) as defined by RFC5246 or RFC6176.		
SMB	This value shall indicate conformance to the Server Message Block (SMB), or Common Internet File System (CIFS), protocol.		
ТСР	This value shall indicate conformance to the IETF-defined Transmission Control Protocol (TCP). For example, RFC7414 defines the roadmap of the TCP specification.		
TFTP	This value shall indicate conformance to the IETF-defined Trivial File Transfer Protocol (TFTP). For example, RFC1350 defines the core TFTP version 2 specification.		

string	Description
UDP	This value shall indicate conformance to the IETF-defined User Datagram Protocol (UDP). For example, RFC768 defines the core UDP specification.
UHCI	This value shall indicate conformance to the Intel Universal Host Controller Interface (UHCI) Specification, Enhanced Host Controller Interface Specification, or the Extensible Host Controller Interface Specification.
USB	This value shall indicate conformance to the USB Implementers Forum Universal Serial Bus Specification.
VGA	This value shall indicate conformance to the VESA SVGA Specification.

9.6.21 IOPerformanceLineOfService 1.1.1

9.6.21.1 Description This structure may be used to define a service option related to IO performance.

9.6.21.2 URIs /redfish/v1/StorageServices/{StorageServiceld}/ClassesOfService/ {*ClassOfServiceld*}/IOPerformanceLinesOfService/{*IOPerformanceLineOfServiceld*} / redfish/v1/StorageServices/{*StorageServiceld*}/LinesOfService/IOPerformanceLinesOfService/{*IOPerformanceLineOfServiceld*}

9.6.21.3 Properties The properties defined for the IOPerformanceLineOfService 1.1.1 schema are summarized in Table 108.

9.6.29.4 Actions

9.6.29.4.1 ExposeVolumes Description

Exposes the storage of this group via the target endpoints named in the ServerEndpointGroups to the initiator endpoints named in the ClientEndpointGroups. The property VolumesAreExposed shall be set to true when this action is completed.

Action URI: {Base URI of target resource}/Actions/StorageGroup.ExposeVolumes

Action parameters

This action takes no parameters.

9.6.29.4.2 HideVolumes Description

Hide the storage of this group from the initiator endpoints named in the ClientEndpointGroups. The property VolumesAreExposed shall be set to false when this action is completed.

Action URI: {Base URI of target resource}/Actions/StorageGroup.HideVolumes

Action parameters

This action takes no parameters.

9.6.29.5 Property details

9.6.29.5.1 AccessCapability: The defined property values are listed in Table 118. Each entry shall specify the storage access capability for this mapped volume.

Table 118: AccessCapability property values ##### AccessState:

string	Description
Read	Endpoints are allowed to perform reads from the specified resource.
ReadWrite	Endpoints are allowed to perform reads from and writes to the specified resource.

The defined property values are listed in Table 119. The value of this property shall describe the access characteristics of this storage group. All associated logical units through all aggregated ports shall share this access state.

string	Description
NonOptimized	This value shall indicate each endpoint is in an active and non-optimized state.
Optimized	This value shall indicate each endpoint is in an active and optimized state.
Standby	This value shall indicate each endpoint is in a standby state.
Transitioning	This value shall indicate each endpoint is transitioning to a new state.
Unavailable	This value shall indicate each endpoint is in an unavailable state.

Table 119: AccessState property values ##### AuthenticationMethod:

The defined property values are listed in Table 120. The value of this property must be what kind of authentication that the endpoints in this StorageGroup understands.

Table 120: AuthenticationMethod property value	les

string	Description
СНАР	iSCSI Challenge Handshake Authentication Protocol (CHAP) authentication is used. For ChapInfo, the CHAPUser and CHAPPassword properties shall be used when type CHAP is selected.
DHCHAP	Diffie-Hellman Challenge Handshake Authentication Protocol (DHCHAP) is an authentication protocol used in Fibre Channel. When MutualCHAP is selected, DHChapInfo shall be used instead of CHAPInfo, and the LocalDHCHAPAuthSecret and PeerDHCHAPAuthSecret properties shall be used.
MutualCHAP	iSCSI Mutual Challenge Handshake Authentication Protocol (CHAP) authentication is used. For ChapInfo, the InitiatorCHAPUser, InitiatorCHAPPassword, TargetCHAPUser, and TargetCHAPPassword properties shall be used when type MutualCHAP is selected.

9.6.31.4 Actions

9.6.31.4.1 AddDrives Description

This action shall be used to add a drive, or set of drives, to an underlying capacity source for the storage pool.

Action URI: {Base URI of target resource}/Actions/StoragePool.AddDrives

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.31.4.1. | Parameter { | object | optional | This parameter shall contain the target capacity source for the drive(s). This property does not need to be specified if the storage pool only contains one capacity source, or if the implementation is capable of automatically selecting the appropriate capacity source. See the CapacitySource schema for details on this property. || @odata.id | string | read-only | Link to a CapacitySource resource. See the Links section and the *CapacitySource* schema for details. || }|||| Drives [{| array | required | This parameter shall contain the Uri to the existing drive or drives to be added to a capacity source of the storage pool. The implementation may impose restrictions on the number of drives added simultaneously. @odata.id| string (URI) | read-only | The value of this property shall be the unique identifier for the resource and it shall be of the form defined in the Redfish specification. }1||| Table: AddDrives action parameters

9.6.31.4.2 RemoveDrives Description

This action shall be used to remove a drive from the StoragePool. This action is targeted at a graceful drive removal process, such as initiating a drive cleanup and

data reallocation before drive removal from the pool. The implementation may impose restrictions on the number of drives removed simultaneously.

Action URI: {Base URI of target resource}/Actions/StoragePool.RemoveDrives

Action parameters

9.6.31.4.3 SetCompressionState Description

This action shall be used to set the compression state of the storage pool. This may be both a highly impactful, as well as a long running operation.

Action URI: {Base URI of target resource}/Actions/StoragePool.SetCompressionState

Action parameters

9.6.31.4.4 SetDeduplicationState Description

This action shall be used to set the dedupe state of the storage pool. This may be both a highly impactful, as well as a long running operation.

Action URI: {Base URI of target resource}/Actions/StoragePool.SetDeduplicationState

Action parameters

9.6.31.4.5 SetEncryptionState Description

This action shall be used to set the encryption state of the storage pool. This may be both a highly impactful, as well as a long running operation.

Action URI: {Base URI of target resource}/Actions/StoragePool.SetEncryptionState

Action parameters

9.6.31.5 Property details

9.6.31.5.1 NVMePoolType: The defined property values are listed in Table 123. This property shall indicate whether the StoragePool is used as an EnduranceGroup or an NVMSet.

Table 123: NVMePoolType property values ##### PoolType:

string	Description
E nduranceGroup	This type shall be used to specify a pool of type EnduranceGroup, used by NVMe devices.
NVMSet	This type shall be used to specify a pool of type NVMSet, used by NVMe devices.

The defined property values are listed in Table 124. The property shall indicate the type of storage pool.

Table 124: PoolType property values ##### SupportedPoolTypes:

string	Description
Block	This type shall be used to specify a pool of type block. This is
	used when the pool serves block storage.

string	Description
File	This type shall be used to specify a pool of type file. This setting is used when the pool serves file storage.
Object	This type shall be used to specify a pool of type object.
Pool	This type shall be used to specify a pool of type pool. This setting is used to indicate a 'pool of pools' hierarchy.

The defined property values are listed in Table 125. This collection shall contain all the PoolType values supported by the storage pool.

Table 125: SupportedPoolTypes property values #####SupportedProvisioningPolicies:

string	Description	
Block	This type shall be used to specify a pool of type block. This is used when the pool serves block storage.	
File	This type shall be used to specify a pool of type file. This setting is used when the pool serves file storage.	
Object	This type shall be used to specify a pool of type object.	
Pool	This type shall be used to specify a pool of type pool. This setting is used to indicate a 'pool of pools' hierarchy.	

The defined property values are listed in Table 126. This collection shall specify all supported storage allocation policies for the Storage Pool.

Table 126: SupportedProvisioningPolicies property values #####SupportedRAIDTypes:

string	Description
Fixed	This enumeration literal specifies storage shall be fully allocated.

string	Description
Thin	This enumeration literal specifies storage may be over allocated.

The defined property values are listed in Table 127. This collection shall contain all the RAIDType values supported by the storage pool.

string	Description
None	A placement policy with no redundancy at the device level.
RAIDO	A placement policy where consecutive logical blocks of data are uniformly distributed across a set of independent storage devices without offering any form of redundancy. This is commonly referred to as data striping. This form of RAID will encounter data loss with the failure of any storage device in the set.
RAID00	A placement policy that creates a RAID 0 stripe set over two or more RAID 0 sets. This is commonly referred to as RAID 0+0. This form of data layout is not fault tolerant; if any storage device fails there will be data loss.
RAID01	A data placement policy that creates a mirrored device (RAID 1) over a set of striped devices (RAID 0). This is commonly referred to as RAID 0+1 or RAID 0/1. Data stored using this form of RAID is able to survive a single RAID 0 data set failure without data loss.
RAID1	A placement policy where each logical block of data is stored on more than one independent storage device. This is commonly referred to as mirroring. Data stored using this form of RAID is able to survive a single storage device failure without data loss.

Table 127: SupportedRAIDTypes property values

string	Description
RAID10	A placement policy that creates a striped device (RAID 0) over a set of mirrored devices (RAID 1). This is commonly referred to as RAID 1/0. Data stored using this form of RAID is able to survive storage device failures in each RAID 1 set without data loss.
RAID10E	A placement policy that uses a RAID 0 stripe set over two or more RAID 10 sets. This is commonly referred to as Enhanced RAID 10. Data stored using this form of RAID is able to survive a single device failure within each nested RAID 1 set without data loss.
RAID10Triple	A placement policy that uses a striped device (RAID 0) over a set of triple mirrored devices (RAID 1Triple). This form of RAID can survive up to two failures in each triple mirror set without data loss.
RAID1E	A placement policy that uses a form of mirroring implemented over a set of independent storage devices where logical blocks are duplicated on a pair of independent storage devices so that data is uniformly distributed across the storage devices. This is commonly referred to as RAID 1 Enhanced. Data stored using this form of RAID is able to survive a single storage device failure without data loss.
RAID1Triple	A placement policy where each logical block of data is mirrored three times across a set of three independent storage devices. This is commonly referred to as three-way mirroring. This form of RAID can survive two device failures without data loss.
RAID3	A placement policy using parity-based protection where logical bytes of data are uniformly distributed across a set of independent storage devices and where the parity is stored on a dedicated independent storage device. Data stored using this form of RAID is able to survive a single storage device failure without data loss. If the storage devices use rotating media, they are assumed to be rotationally synchronized, and the data stripe size should be no larger than the exported block size.

string	Description
RAID4	A placement policy using parity-based protection where logical blocks of data are uniformly distributed across a set of independent storage devices and where the parity is stored on a dedicated independent storage device. Data stored using this form of RAID is able to survive a single storage device failure without data loss.
RAID5	A placement policy using parity-based protection for storing stripes of 'n' logical blocks of data and one logical block of parity across a set of 'n+1' independent storage devices where the parity and data blocks are interleaved across the storage devices. Data stored using this form of RAID is able to survive a single storage device failure without data loss.
RAID50	A placement policy that uses a RAID 0 stripe set over two or more RAID 5 sets of independent storage devices. Data stored using this form of RAID is able to survive a single storage device failure within each RAID 5 set without data loss.
RAID6	A placement policy using parity-based protection for storing stripes of 'n' logical blocks of data and two logical blocks of independent parity across a set of 'n+2' independent storage devices where the parity and data blocks are interleaved across the storage devices. Data stored using this form of RAID is able to survive any two independent storage device failures without data loss.
RAID60	A placement policy that uses a RAID 0 stripe set over two or more RAID 6 sets of independent storage devices. Data stored using this form of RAID is able to survive two device failures within each RAID 6 set without data loss.
RAID6TP	A placement policy that uses parity-based protection for storing stripes of 'n' logical blocks of data and three logical blocks of independent parity across a set of 'n+3' independent storage devices where the parity and data blocks are interleaved across the storage devices. This is commonly referred to as Triple Parity RAID. Data stored using this form of RAID is able to survive any three independent storage device failures without data loss.

9.6.37.4 Actions

9.6.37.4.1 AssignReplicaTarget (v1.4+) Description

This action shall be used to establish a replication relationship by assigning an existing volume to serve as a target replica for an existing source volume.

Action URI: {Base URI of target resource}/Actions/Volume.AssignReplicaTarget

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.37.4.1. | Parameter Name | Type | Attributes | Notes | |:- |:- |:- |:- -- || **ReplicaType** | string (enum) | *required* | This parameter shall contain the type of replica relationship to be created (e.g., Clone, Mirror, Snap). *For the possible property values, see ReplicaType in Property details.* || **ReplicaUpdateMode** | string (enum) | *required* | This parameter shall specify the replica update mode. *For the possible property values, see ReplicaUpdateMode in Property details.* || **TargetVolume** | string | *required* | This parameter shall contain the Uri to the existing target volume. | Table: AssignReplicaTarget action parameters

9.6.37.4.2 ChangeRAIDLayout (v1.5+) Description

This action shall request the system to change the RAID layout of the volume. Depending on the combination of the submitted parameters, this could be changing the RAID type, changing the span count, changing the number of drives used by the volume, or another configuration change supported by the system. Note that usage of this action while online may potentially cause data loss if the available capacity is reduced.

Action URI: {Base URI of target resource}/Actions/Volume.ChangeRAIDLayout

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.37.4.2. | Parameter **Drives** [{ | array | optional | This parameter shall contain an array of the drives to be used by the volume. @odata.id | string (URI) | read-only | The value of this property shall be the unique identifier for the resource and it shall be of the form defined in the Redfish specification. || }]|||| **MediaSpanCount** | integer | *optional* | This parameter shall contain the requested number of media elements used per span in the secondary RAID for a hierarchical RAID type. **RAIDType** | string (enum) | *optional* | This parameter shall contain the requested RAID type for the volume. For the possible property values, see RAIDType in Property details. StripSizeBytes | integer | optional | This parameter shall contain the number of blocks (bytes) requested for the strip size. | Table: ChangeRAIDLayout action parameters

9.6.37.4.3 CheckConsistency Description

This defines the name of the custom action supported on this resource.

Action URI: {Base URI of target resource}/Actions/Volume.CheckConsistency

Action parameters

This action takes no parameters.

9.6.37.4.4 CreateReplicaTarget (v1.4+) Description

This action shall be used to create a new volume resource to provide expanded data protection through a replica relationship with the specified source volume.

Action URI: {Base URI of target resource}/Actions/Volume.CreateReplicaTarget

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.37.4.4. | Parameter Name | Type | Attributes | Notes | | :-- | :-- | :-- -- || **ReplicaType** | string (enum) | *required* | This parameter shall contain the type of replica relationship to be created (e.g., Clone, Mirror, Snap). *For the possible property values, see ReplicaType in Property details.* || **ReplicaUpdateMode** | string (enum) | *required* | This parameter shall specify the replica update mode. *For the possible property values, see*

ReplicaUpdateMode in Property details. ||TargetStoragePool | string | required |This parameter shall contain the Uri to the existing StoragePool in which to create thetarget volume. ||VolumeName | string | optional | This parameter shall contain theName for the target volume. | Table: CreateReplicaTarget action parameters

9.6.37.4.5 ForceEnable (v1.5+) Description

This action shall request the system to force the volume to enabled state regardless of data loss scenarios.

Action URI: {Base URI of target resource}/Actions/Volume.ForceEnable

Action parameters

This action takes no parameters.

9.6.37.4.6 Initialize (v1.5+) Description

This defines the name of the custom action supported on this resource. If InitializeMethod is not specified in the request body, but the property InitializeMethod is specified, the property InitializeMethod value should be used. If neither is specified, the InitializeMethod should be Foreground.

Action URI: {Base URI of target resource}/Actions/Volume.Initialize

Action parameters

9.6.37.4.7 RemoveReplicaRelationship (v1.4+) Description

This action shall be used to disable data synchronization between a source and target volume, remove the replication relationship, and optionally delete the target volume.

Action URI: {Base URI of target resource}/Actions/Volume.RemoveReplicaRelationship

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.37.4.7. | Parameter Name | Type | Attributes | Notes | | :-- | :-- | :-- --- || **DeleteTargetVolume** | boolean | *optional* | This parameter shall indicate whether or not to delete the target volume as part of the operation. If not defined, the system should use its default behavior. || **TargetVolume** | string | *required* | This parameter shall contain the Uri to the existing target volume. | Table: RemoveReplicaRelationship action parameters

9.6.37.4.8 ResumeReplication (v1.4+) Description

This action shall be used to resume the active data synchronization between a source and target volume, without otherwise altering the replication relationship.

Action URI: {Base URI of target resource}/Actions/Volume.ResumeReplication

Action parameters

9.6.37.4.9 ReverseReplicationRelationship (v1.4+) Description

This action shall be used to reverse the replication relationship between a source and target volume.

Action URI: {Base URI of target resource}/Actions/Volume.ReverseReplicationRelationship

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.37.4.9. | Parameter Name | Type | Attributes | Notes | | :-- | :-- | :-- | :-- --- | | **TargetVolume** | string | *required* | This parameter shall contain the Uri to the existing target volume. | Table: ReverseReplicationRelationship action parameters

9.6.37.4.10 SplitReplication (v1.4+) Description

This action shall be used to split the replication relationship and suspend data synchronization between a source and target volume.

Action URI: {Base URI of target resource}/Actions/Volume.SplitReplication

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.37.4.10. | Parameter Name | Type | Attributes | Notes | | :-- | :-- | :-- | :-- --- | | **TargetVolume** | string | *required* | This parameter shall contain the Uri to the existing target volume. | Table: SplitReplication action parameters

9.6.37.4.11 SuspendReplication (v1.4+) Description

This action shall be used to suspend active data synchronization between a source and target volume, without otherwise altering the replication relationship.

Action URI: {Base URI of target resource}/Actions/Volume.SuspendReplication

Action parameters

The parameters for the action which are included in the POST body to the URI shown in the 'target' property of the Action are summarized in Table 9.6.37.4.11. | Parameter Name | Type | Attributes | Notes | | :-- | :-- | :-- | :-- --- | | **TargetVolume** | string | *required* | This parameter shall contain the Uri to the existing target volume. | Table: SuspendReplication action parameters

9.6.37.5 Property details

9.6.37.5.1 AccessCapabilities: The defined property values are listed in Table 135. Each entry shall specify a current storage access capability.

string	Description
Append	This enumeration literal shall indicate that the storage may be written only to append.
Execute	This value shall indicate that Execute access is allowed by the file share.
Read	This enumeration literal shall indicate that the storage may be read.
Streaming	This enumeration literal shall indicate that the storage may be read sequentially.

 Table 135: AccessCapabilities property values ##### EncryptionTypes:

string	Description
Write	This enumeration literal shall indicate that the storage may be written multiple times.
WriteOnce	This enumeration literal shall indicate that the storage may be written only once.

The defined property values are listed in Table 136. This property shall contain the types of encryption used by this Volume.

string	Description
Contr ollerAssisted	The volume is being encrypted by the storage controller entity.
NativeDr iveEncryption	The volume is utilizing the native drive encryption capabilities of the drive hardware.
Sof twareAssisted	The volume is being encrypted by software running on the system or the operating system.

Table 136: EncryptionTypes property values ##### InitializeMethod:

The defined property values are listed in Table 137. This defines the property name for the action.

 Table 137: InitializeMethod property values ##### InitializeType:

string	Description
Background	The volume will be available for use immediately, with data erasure and preparation to happen as background tasks.
Foreground	Data erasure and preparation tasks will complete before the volume is presented as available for use.
Skip	The volume will be available for use immediately, with no preparation.

The defined property values are listed in Table 138. This defines the property name for the action.

string	Description
Fast	The volume is prepared for use quickly, typically by erasing just the beginning and end of the space so that partitioning can be performed.
Slow	The volume is prepared for use slowly, typically by completely erasing the volume.

Table 138: InitializeType property values ##### LBAFormatsSupported:

The defined property values are listed in Table 139. This shall be a list of the LBA formats supported for the namespace, or potential namespaces.

string	Description
LBAFormat0	LBAFormat0 is a required type. Indicates the LBA data size supported.
LBAFormat1	Indicates the LBA data size if supported.
LBAFormat10	Indicates the LBA data size supported if supported.
LBAFormat11	Indicates the LBA data size supported if supported.
LBAFormat12	Indicates the LBA data size supported if supported.
LBAFormat13	Indicates the LBA data size supported if supported.
LBAFormat14	Indicates the LBA data size supported if supported.
LBAFormat15	Indicates the LBA data size supported if supported.
LBAFormat2	Indicates the LBA data size supported if supported.
LBAFormat3	Indicates the LBA data size supported if supported.
LBAFormat4	Indicates the LBA data size supported if supported.
LBAFormat5	Indicates the LBA data size supported if supported.
LBAFormat6	Indicates the LBA data size supported if supported.
LBAFormat7	Indicates the LBA data size supported if supported.
LBAFormat8	Indicates the LBA data size supported if supported.

Table 139: LBAFormatsSupported property values ##### ProvisioningPolicy:

string	Description
LBAFormat9	Indicates the LBA data size supported if supported.

The defined property values are listed in Table 140. This property shall specify the volume's supported storage allocation policy.

Table 140: ProvisioningPolicy property values ##### RAIDType:

string	Description
Fixed	This enumeration literal specifies storage shall be fully allocated.
Thin	This enumeration literal specifies storage may be over allocated.

The defined property values are listed in Table 141. This parameter shall contain the requested RAID type for the volume.

string	Description
None (v1.4.2+)	A placement policy with no redundancy at the device level.
RAIDO	A placement policy where consecutive logical blocks of data are uniformly distributed across a set of independent storage devices without offering any form of redundancy. This is commonly referred to as data striping. This form of RAID will encounter data loss with the failure of any storage device in the set.
RAID00	A placement policy that creates a RAID 0 stripe set over two or more RAID 0 sets. This is commonly referred to as RAID 0+0. This form of data layout is not fault tolerant; if any storage device fails there will be data loss.

Table 141: RAIDType property values ##### ReadCachePolicy:

string	Description
RAID01	A data placement policy that creates a mirrored device (RAID 1) over a set of striped devices (RAID 0). This is commonly referred to as RAID 0+1 or RAID 0/1. Data stored using this form of RAID is able to survive a single RAID 0 data set failure without data loss.
RAID1	A placement policy where each logical block of data is stored on more than one independent storage device. This is commonly referred to as mirroring. Data stored using this form of RAID is able to survive a single storage device failure without data loss.
RAID10	A placement policy that creates a striped device (RAID 0) over a set of mirrored devices (RAID 1). This is commonly referred to as RAID 1/0. Data stored using this form of RAID is able to survive storage device failures in each RAID 1 set without data loss.
RAID10E	A placement policy that uses a RAID 0 stripe set over two or more RAID 10 sets. This is commonly referred to as Enhanced RAID 10. Data stored using this form of RAID is able to survive a single device failure within each nested RAID 1 set without data loss.
RAID10Triple	A placement policy that uses a striped device (RAID 0) over a set of triple mirrored devices (RAID 1Triple). This form of RAID can survive up to two failures in each triple mirror set without data loss.
RAID1E	A placement policy that uses a form of mirroring implemented over a set of independent storage devices where logical blocks are duplicated on a pair of independent storage devices so that data is uniformly distributed across the storage devices. This is commonly referred to as RAID 1 Enhanced. Data stored using this form of RAID is able to survive a single storage device failure without data loss.

string	Description
RAID1Triple	A placement policy where each logical block of data is mirrored three times across a set of three independent storage devices. This is commonly referred to as three-way mirroring. This form of RAID can survive two device failures without data loss.
RAID3	A placement policy using parity-based protection where logical bytes of data are uniformly distributed across a set of independent storage devices and where the parity is stored on a dedicated independent storage device. Data stored using this form of RAID is able to survive a single storage device failure without data loss. If the storage devices use rotating media, they are assumed to be rotationally synchronized, and the data stripe size should be no larger than the exported block size.
RAID4	A placement policy using parity-based protection where logical blocks of data are uniformly distributed across a set of independent storage devices and where the parity is stored on a dedicated independent storage device. Data stored using this form of RAID is able to survive a single storage device failure without data loss.
RAID5	A placement policy using parity-based protection for storing stripes of 'n' logical blocks of data and one logical block of parity across a set of 'n+1' independent storage devices where the parity and data blocks are interleaved across the storage devices. Data stored using this form of RAID is able to survive a single storage device failure without data loss.
RAID50	A placement policy that uses a RAID 0 stripe set over two or more RAID 5 sets of independent storage devices. Data stored using this form of RAID is able to survive a single storage device failure within each RAID 5 set without data loss.

string	Description
RAID6	A placement policy using parity-based protection for storing stripes of 'n' logical blocks of data and two logical blocks of independent parity across a set of 'n+2' independent storage devices where the parity and data blocks are interleaved across the storage devices. Data stored using this form of RAID is able to survive any two independent storage device failures without data loss.
RAID60	A placement policy that uses a RAID 0 stripe set over two or more RAID 6 sets of independent storage devices. Data stored using this form of RAID is able to survive two device failures within each RAID 6 set without data loss.
RAID6TP	A placement policy that uses parity-based protection for storing stripes of 'n' logical blocks of data and three logical blocks of independent parity across a set of 'n+3' independent storage devices where the parity and data blocks are interleaved across the storage devices. This is commonly referred to as Triple Parity RAID. Data stored using this form of RAID is able to survive any three independent storage device failures without data loss.

The defined property values are listed in Table 142. This property shall contain a boolean indicator of the read cache policy for the Volume.

string	Description
Adap tiveReadAhead	A caching technique in which the controller dynamically determines whether to pre-fetch data anticipating future read requests, based on previous cache hit ratio.
Off	The read cache is disabled.
ReadAhead	A caching technique in which the controller pre-fetches data anticipating future read requests.

Table 142: ReadCachePolicy property values ##### ReplicaType:

The defined property values are listed in Table 143. This parameter shall contain the

type of replica relationship to be created (e.g., Clone, Mirror, Snap).

string	Description
Clone	This enumeration literal shall indicate that replication shall create a point in time, full copy the source.
Mirror	This enumeration literal shall indicate that replication shall create and maintain a copy of the source.
Snapshot	This enumeration literal shall indicate that replication shall create a point in time, virtual copy of the source.
T okenizedClone	This enumeration literal shall indicate that replication shall create a token based clone.

Table 143: ReplicaType property values ##### ReplicaUpdateMode:

The defined property values are listed in Table 144. This parameter shall specify the replica update mode.

string	Description
Active	This enumeration literal shall indicate Active-Active (i.e. bidirectional) synchronous updates.
Adaptive	This enumeration literal shall indicate that an implementation may switch between synchronous and asynchronous modes.
Asynchronous	This enumeration literal shall indicate Asynchronous updates.
Synchronous	This enumeration literal shall indicate Synchronous updates.

Table 144: ReplicaUpdateMode property values ##### VolumeType:

The defined property values are listed in Table 145. This property shall contain the type of the associated Volume.

Table 145: VolumeType property values ##### VolumeUsage:

string	Description
Mirrored	The volume is a mirrored device.
NonRedundant	The volume is a non-redundant storage device.
RawDevice	The volume is a raw physical device without any RAID or other virtualization applied.
S pannedMirrors	The volume is a spanned set of mirrored devices.
SpannedStri pesWithParity	The volume is a spanned set of devices which uses parity to retain redundant information.
Stri pedWithParity	The volume is a device which uses parity to retain redundant information.

The defined property values are listed in Table 146. This property shall contain the volume usage type for the Volume.

string	Description
CacheOnly	The volume shall be allocated for use as a non-consumable cache only volume.
Data	The volume shall be allocated for use as a consumable data volume.
Repli cationReserve	The volume shall be allocated for use as a non-consumable reserved volume for replication use.
SystemData	The volume shall be allocated for use as a consumable data volume reserved for system use.
SystemReserve	The volume shall be allocated for use as a non-consumable system reserved volume.

Table 146: VolumeUsage property values ##### WriteCachePolicy:

The defined property values are listed in Table 147. This property shall contain a boolean indicator of the write cache policy for the Volume.

string	Description
Off (v1.4.1+)	Indicates that the write cache shall be disabled.
Prote ctedWriteBack	A caching technique in which the completion of a write request is signaled as soon as the data is in cache, and actual writing to non-volatile media is guaranteed to occur at a later time.
Unprote ctedWriteBack	A caching technique in which the completion of a write request is signaled as soon as the data is in cache; actual writing to non-volatile media is not guaranteed to occur at a later time.
WriteThrough	A caching technique in which the completion of a write request is not signaled until data is safely stored on non-volatile media.

Table 147: WriteCachePolicy property values ##### WriteCacheState:

The defined property values are listed in Table 148. This property shall contain the WriteCacheState policy setting for the Volume.

string	Description
Degraded	Indicates an issue with the cache state in which the cache space is diminished or disabled due to a failure or an outside influence such as a discharged battery.
Protected	Indicates that the cache state type in use generally protects write requests on non-volatile media.
Unprotected	Indicates that the cache state type in use generally does not protect write requests on non-volatile media.

Table 148: WriteCacheState property values ##### WriteHoleProtectionPolicy:

The defined property values are listed in Table 149. This property specifies the policy that is enabled to address the write hole issue on the RAID volume. If no policy is enabled at the moment, this property shall be set to 'Off'.

string	Description
D istributedLog	The policy that distributes additional log (e.q. checksum of the parity) among the volume's capacity sources to address write hole issue. Additional data is used to detect data corruption on the volume.
Journaling	The policy that uses separate block device for write-ahead logging to address write hole issue. All write operations on the RAID volume are first logged on dedicated journaling device that is not part of the volume.
Oem	The policy that is Oem specific. The mechanism details are unknown unless provided separately by the Oem.
Off	The support for addressing the write hole issue is disabled. The volume is not performing any additional activities to close the RAID write hole.

Table 149: WriteHoleProtectionPolicy property values
