ABSTRACT: This CDMI International Standard is intended for application developers who are implementing or using cloud storage. It documents how to access cloud storage and to manage the data stored there.

Publication of this Working Draft for review and comment has been approved by the Cloud Storage Technical Working Group. This draft represents a “best effort” attempt by the Cloud Storage Technical Working Group to reach preliminary consensus, and it may be updated, replaced, or made obsolete at any time. This document should not be used as reference material or cited as other than a “work in progress.” Suggestions for revision should be directed to http://www.snia.org/feedback/.

Working Draft

May 21, 2020

# Table of Contents:

I CDMI Preamble  
Clause 1: Scope  
Clause 2: Normative references  
Clause 3: Terms, acronyms, and definitions  
Clause 4: Conventions  
4.1 Interface format  
4.2 Typographical conventions  
4.3 Request and response body requirements  
4.4 Key Word requirements  
Clause 5: Overview of Cloud Storage  
5.1 Overview  
5.2 Reference model for cloud storage interfaces  
5.3 Cloud data management interface  
5.4 Security  
5.5 Required HTTP support  
5.6 Time representations  
5.7 Backwards compatibility  
5.8 Object references  
II Basic Cloud Storage  
Clause 6: Data Object Resource Operations using HTTP  
6.1 Overview  
6.2 Create a data object using HTTP  
6.3 Read a data object using HTTP  
6.4 Update a data object using HTTP  
6.5 Delete a data object using HTTP  
Clause 7: Container Object Resource Operations using HTTP  
7.1 Overview  
7.2 Create a container object using HTTP  
7.3 Read a container object using HTTP  
7.4 Update a container object using HTTP  
7.5 Delete a container object using HTTP  
7.6 Create (POST) a new data object using HTTP  
III CDMI Core  
Clause 8: Data Object Resource Operations using CDMI  
8.1 Overview  
8.2 Data object details  
8.3 Create a data object using CDMI  
8.4 Read a data object using CDMI  
8.5 Update a data object using CDMI  
8.6 Delete a data object using CDMI  
Clause 9: Container Object Resource Operations using CDMI  
© SNIA 2020 SNIA Working Draft
### IV CDMI Advanced

<table>

Part I

CDMI Preamble
This Cloud Data Management Interface (CDMI™) International Standard is intended for application developers who are implementing or using cloud storage. It documents how to access cloud storage and to manage the data stored there.

This document is organized as follows:

<table>
<thead>
<tr>
<th>Clause</th>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clause 1</td>
<td>Scope</td>
<td>Defines the scope of this document</td>
</tr>
<tr>
<td>Clause 2</td>
<td>Normative references</td>
<td>Lists the normative references for this document</td>
</tr>
<tr>
<td>Clause 3</td>
<td>Terms</td>
<td>Provides terminology used in this document</td>
</tr>
<tr>
<td>Clause 4</td>
<td>Conventions</td>
<td>Describes the conventions used in presenting the interfaces and the typographical conventions used in this document</td>
</tr>
<tr>
<td>Clause 5</td>
<td>Overview of Cloud Storage</td>
<td>Provides a brief overview of cloud storage and details the philosophy behind this International Standard as a model for the operations</td>
</tr>
<tr>
<td>Clause 6</td>
<td>Data Object Resource Operations using HTTP</td>
<td>Provides the normative standard of data object resource operations using HTTP</td>
</tr>
<tr>
<td>Clause 7</td>
<td>Container Object Resource Operations using HTTP</td>
<td>Provides the normative standard of container object resource operations using HTTP</td>
</tr>
<tr>
<td>Clause 8</td>
<td>Data Object Resource Operations using CDMI</td>
<td>Provides the normative standard of data object resource operations using CDMI</td>
</tr>
<tr>
<td>Clause 9</td>
<td>Container Object Resource Operations using CDMI</td>
<td>Provides the normative standard of container object resource operations using CDMI</td>
</tr>
<tr>
<td>Clause 10</td>
<td>Domain Object Resource Operations using CDMI</td>
<td>Provides the normative standard of domain object resource operations using CDMI</td>
</tr>
<tr>
<td>Clause 11</td>
<td>Queue Object Resource Operations using CDMI</td>
<td>Provides the normative standard of queue object resource operations using CDMI</td>
</tr>
<tr>
<td>Clause 12</td>
<td>Capability Object Resource Operations using CDMI</td>
<td>Provides the normative standard of capability object resource operations using CDMI</td>
</tr>
<tr>
<td>Clause 13</td>
<td>Exported Protocols</td>
<td>Discusses how virtual machines in the cloud computing environment can use the exported protocols from CDMI containers</td>
</tr>
<tr>
<td>Clause 14</td>
<td>Snapshots</td>
<td>Discusses how snapshots are accessed under CDMI containers</td>
</tr>
<tr>
<td>Clause 15</td>
<td>Serialization/Deserialization</td>
<td>Discusses serialization and deserialization, including import and export of serialized data under CDMI</td>
</tr>
<tr>
<td>Clause 16</td>
<td>Metadata</td>
<td>Provides the normative standard of the metadata used in the interface</td>
</tr>
<tr>
<td>Clause 17</td>
<td>Retention and Hold Management</td>
<td>Describes the optional retention management disciplines to be implemented into the system management functions</td>
</tr>
<tr>
<td>Clause 18</td>
<td>Scope Specification</td>
<td>Describes the structure of the scope specification for JSON objects</td>
</tr>
<tr>
<td>Clause 19</td>
<td>Results Specification</td>
<td>Provides a standardized mechanism to define subsets of CDMI object contents</td>
</tr>
<tr>
<td>Clause 20</td>
<td>Notification Queues</td>

Clause 1

Scope

This CDMI™ International Standard specifies the interface to access cloud storage and to manage the data stored therein. This International Standard applies to developers who are implementing or using cloud storage.
Clause 2

Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

The provisions of the referenced specifications other than ISO/IEC, IEC, ISO, and ITU documents, as identified in this clause, are valid within the context of this International Standard. The reference to such a specification within this International Standard does not give it any further status within ISO/IEC. In particular, it does not give the referenced specifications the status of an International Standard.

ISO 3166:2013, Codes for the representation of names of countries and their subdivisions (Parts 1, 2 and 3) - see [35][36][37]

ISO 4217:2015, Codes for the representation of currencies and funds - see [38]

Clause 3

Terms, acronyms, and definitions

For the purposes of this document, the terms and definitions given in Rec. ITU-T Y.3500 | ISO/IEC 17788:2014 and the following apply.

3.1
Access Control List (ACL)
a persistent list, commonly composed of Access Control Entries (ACEs), that enumerates the rights of principals (users and groups) to access resources

3.2
API
Application Programming Interface

3.3
CDMI™
Cloud Data Management Interface

3.4
CDMI capabilities
an object that describes what operations are supported for a given cloud or cloud object
The mimetype for this object is application/cdmi-capability.

3.5
CDMI container
an object that stores zero or more children objects and associated metadata
The mimetype for this object is application/cdmi-container.

3.6
CDMI data object
an object that stores an array of bytes (value) and associated metadata
The mimetype for this object is application/cdmi-object.

3.7
CDMI domain
an object that stores zero or more children domains and associated metadata describing object administrative ownership
The mimetype for this object is application/cdmi-domain.
3.8

CDMI object
one of CDMI capabilities, CDMI container, CDMI data object, CDMI domain, or CDMI queue

3.9

CDMI queue
an object that stores a first-in, first-out set of values and associated metadata
The mimetype for this object is application/cdmi-queue.

3.10

CIFS
Common Internet File System (See SMB)

3.11

cloud storage
See Data storage as a Service

3.12

CRC
cyclic redundancy check

3.13

current data object version
the most recent version of a version-enabled data object

3.14

data object version
either the current data object version or an historical data object version

3.15

Data Storage as a Service (DSaaS)
delivery of appropriately configured virtual storage and related data services over a network, based on a request for a given service level

3.16

delegated access control (DAC)
the process of delegating an access control decision to a third party

3.17

delegated access control provider (DAC provider)
a third-party system that is capable of making access control decisions

3.18

delegated access control request (DAC request)
a request made to a DAC provider for an access control decision

3.19

delegated access control response (DAC response)
a response from a DAC provider indicating the result of a request for an access control decision
3.20 domain
a shared user authorization database that contains users, groups, and their security policies and associated accounting information
Each CDMI object belongs to a single domain, and each domain provides user mapping and accounting information.

3.21 eventual consistency
a behavior of transactional systems that does not provide immediate consistency guarantees to provide enhanced system availability and tolerance to network partitioning

3.22 FC
Fibre Channel

3.23 FCoE
Fibre Channel over Ethernet

3.24 historical data object version
a non-current state of a version-enabled data object

3.25 HTTP
HyperText Transfer Protocol

3.26 Infrastructure as a Service (IaaS)
delivery over a network of an appropriately configured virtual computing environment, based on a request for a given service level
Typically, IaaS is either self-provisioned or provisionless and is billed based on consumption.

3.27 intermediary CDMI server
a CDMI server that is capable of forwarding DAC requests and responses

3.28 iSCSI
Internet Small Computer Systems Interface (see RFC 7143 [4])

3.29 JOSE
JavaScript Object Signing and Encryption

3.30 JWA
JSON Web Algorithm
3.31 JWE
JSON Web Encryption

3.32 JWS
JSON Web Signing

3.33 JSON
JavaScript Object Notation

3.34 LDAP
Lightweight Directory Access Protocol

3.35 LUN
Logical Unit Number (see ISO/IEC 14776-414)

3.36 metadata
data about other data (see [34])

3.37 MIME
Multipurpose Internet Mail Extensions (see RFC 2045 [9])

3.38 NFS
Network File System (see RFC 3530 [1])

3.39 object
an entity that has an object ID, has a unique URI, and contains state
Types of CDMI objects include data objects, container objects, capability objects, domain objects, and queue objects.

3.40 object identifier
a globally-unique value assigned at creation time to identify an object

3.41 OCCI
Open Cloud Computing Interface (see [40])

3.42 Platform as a Service (PaaS)
delivery over a network of a virtualized programming environment, consisting of an application deployment stack based on a virtual computing environment
Typically, PaaS is based on IaaS, is either self-provisioned or provisionless, and is billed based on consumption.
3.43
POSIX
Portable Operating System Interface (see IEEE Std 1003.1)

3.44
private cloud
delivery of SaaS, PaaS, IaaS, and/or DaaS to a restricted set of customers, usually within a single organization
Private clouds are created due to issues of trust.

3.45
public cloud
delivery of SaaS, PaaS, IaaS, and/or DaaS to, in principle, a relatively unrestricted set of customers

3.46
Representational State Transfer (REST)
a specific set of principles for defining, addressing, and interacting with resources addressable by URIs (see [7])

3.47
RPO
recovery point objective

3.48
RTO
recovery time objective

3.49
service level
performance targets for a service

3.50
Server Message Block
A network file system access protocol designed primarily used by Windows clients to communicate file access requests to Windows servers. (Also see CIFS)

3.51
SNMP
Simple Network Management Protocol

3.52
Software as a Service (SaaS)
delivery over a network, on demand, of the use of an application
technology that allocates the physical capacity of a volume or file system as applications write data, rather than pre-allocating all the physical capacity at the time of provisioning.

3.53
Uniform Resource Identifier (URI)
compact sequence of characters that identifies an abstract or physical resource (see RFC 3986 [2])

3.54
version-enabled data object
a CDMI data object with versioning enabled
3.55 virtualization
presentation of resources as if they are physical, when in fact, they are decoupled from the underlying physical resources

3.56 WebDAV
Web Distributed Authoring and Versioning (see RFC 4918 [6])
Clause 4

Conventions

4.1 Interface format

Each interface description has nine components, as described in Table 2.

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synopsis</td>
<td>The GET, PUT, POST, PATCH, and DELETE semantics</td>
</tr>
<tr>
<td>Delayed completion</td>
<td>For long-running operations, a description of behavior when the operation does not immediately complete</td>
</tr>
<tr>
<td>Capabilities</td>
<td>A description of the supported operations</td>
</tr>
<tr>
<td>Request headers</td>
<td>The request headers, such as Accept, Authorization, Content-Length, Content-Type</td>
</tr>
<tr>
<td>Request message body</td>
<td>A description of the message body contents</td>
</tr>
<tr>
<td>Response headers</td>
<td>The response headers, such as Content-Length, Content-Type</td>
</tr>
<tr>
<td>Response message body</td>
<td>A description of the message body contents</td>
</tr>
<tr>
<td>Response Status</td>
<td>A list of HTTP status codes</td>
</tr>
<tr>
<td>Example</td>
<td>An example of the operation</td>
</tr>
</tbody>
</table>
4.2 Typographical conventions

All code text and HTTP status codes are shown in a fixed-width font.

API requests also include a prefix to indicate the source of the request or reply:

- Client-initiated requests are prefixed with `-->`
- Server-initiated replies are prefixed with `<--`

An example is included below:

```bash
--> PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object
--> Content-Type: application/cdmi-object
--> 
--> { 
-->   "mimetype" : "text/plain",
-->   "metadata" : { 
-->     ...
-->   },
-->   "value" : "This is the Value of this Data Object"
--> }
```  

Similarly, HTTP status codes are shown in a fixed-width font, as in:

```
<-- HTTP/1.1 202 Accepted
<-- Location: https://cloud.example.com/cdmi/2.0.0/MyContainer/MyDataObject.txt
```

Requesting an optional field that is not present shall result in an HTTP status code of 404 Not Found.
4.3 Request and response body requirements

In request and response body tables, the Requirement column contains one of the following three values:

- Mandatory. The value specified in this row shall be provided.
- Conditional. If the conditions specified in the Description cell is met, the value specified in this row shall be provided. Otherwise, it may be provided unless the Description specifically prohibits it, in which case it shall not be provided.
- Optional. The value specified in this row may be provided.
4.4 Key Word requirements

In this International Standard, the key words in Table 3 shall be interpreted as described in ISO/IEC Directives, Part 2.

Table 3 — Key word requirements

<table>
<thead>
<tr>
<th>Key words</th>
<th>Denotes</th>
<th>Description</th>
<th>Equivalent expressions (for exception cases only)</th>
</tr>
</thead>
<tbody>
<tr>
<td>shall</td>
<td>requirement</td>
<td>An action that is unconditionally required.</td>
<td>• is to</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Do not use must as an alternative to shall.</td>
<td>• is required to</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• To express a direct instruction, for example, when referring to steps to</td>
<td>• it is required that</td>
</tr>
<tr>
<td></td>
<td></td>
<td>be taken in a test method, use the imperative mood in English.</td>
<td>• has to</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• EXAMPLE: Switch on the recorder.</td>
<td>• only … is permitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• it is necessary</td>

</tbody>
</table>
 Clause 5

Overview of Cloud Storage

5.1 Overview

5.1.1 General Context

When discussing cloud storage and standards, it is important to distinguish the various resources that are being offered as services. These resources are exposed to clients as functional interfaces (i.e., data paths) and are managed by management interfaces (i.e., control paths). This International Standard explores the various types of interfaces that are part of cloud services today and shows how they are related. This International Standard defines a model for the interfaces that can be mapped to the various cloud services and a model that forms the basis for cloud storage interfaces into the future.

Another important concept in this International Standard is that of metadata. When managing large amounts of data with differing requirements, metadata is a convenient mechanism to express those requirements in such a way that underlying data services can differentiate their treatment of the data to meet those requirements.

The appeal of cloud storage is due to some of the same attributes that define other cloud services: pay as you go, the illusion of infinite capacity (elasticity), and the simplicity of use/management. It is therefore important that any interface for cloud storage support these attributes, while allowing for a multitude of business use cases.

5.1.2 What is Cloud Storage?

The use of the term cloud in describing these new models arose from architecture drawings that typically used a cloud as the icon for a network. The cloud represents any-to-any network connectivity in an abstract way. In this abstraction, the network connectivity in the cloud is represented without concern for how it is made to happen.

The cloud abstraction of complexity produces a simple base on which other features can be built. The general cloud model extends this base by adding a pool of resources. An important part of the cloud model is the concept of a pool of resources that is drawn from, on demand, in small increments. A relatively recent innovation that has made this possible is virtualization.

Thus, cloud storage is simply the delivery of virtualized storage on demand. The formal term that is used for this is Data storage as a Service (DaaS).

5.1.3 Data Storage as a Service

By abstracting data storage behind a set of service interfaces and delivering it on demand, a wide range of actual cloud services and implementations are possible. The only type of storage that is excluded from this definition is that which is delivered in fixed-capacity increments instead of that which is based on demand.

An important part of any DaaS system is the support of legacy clients. Support is accommodated with existing standard protocols such as iSCSI (and others) for block network storage and SMB/NFS or WebDAV for file network storage, as shown in Fig. 1.

The difference between purchasing a dedicated appliance or purchasing cloud storage is not the functional interface, but the fact that the storage is delivered on demand. Customers pay for either what they actually use or what they have
allocated for use. For block storage, a Logical Unit Number (LUN), or virtual volume, is the granularity of allocation. For file protocols, a file system is the unit of granularity. In either case, the actual storage space may be thin-provisioned and billed for based on actual usage. Data services, such as compression and deduplication, can be used to further reduce the actual space consumed.

Managing this storage is typically done out of band for these standard data storage interfaces, either through an API, or more commonly, through an administrative browser-based user interface. This out-of-band interface can be used to invoke other data services as well (e.g., snapshots or cloning).

In this model, the underlying storage space that has been exposed by the out-of-band interfaces is abstracted and exposed using the notion of a container. A container is not only a useful abstraction for storage space, but also serves as a grouping of the data stored in it and a point of control for applying data services in the aggregate.

Each data object is created, retrieved, updated, and deleted as a separate resource. In this type of interface, a container, if used, is a simple grouping of data objects for convenience. Nothing prevents the concept of containers from being hierarchical, although any given implementation might support only a single level (see Fig. 2).

### 5.1.4 Data management for cloud storage

Many of the initial implementations of cloud storage focused on a kind of best effort quality of storage service and ignored most other types of data services. To address the needs of enterprise applications with cloud storage, however, there is an increasing need to offer better quality of service and to deploy additional data services.

Cloud storage can lose its abstraction and simplicity benefits if new data services that require complex management are added. Cloud storage customers are likely to resist new demands on their time (e.g., setting up backup schedules through dedicated interfaces, deploying data services individually for stored objects).

By supporting metadata in a cloud storage interface and prescribing how the storage system and data system metadata is interpreted to meet the requirements of the data, the simplicity required by the cloud storage model can be maintained while still addressing the requirements of enterprise applications and their data.

User metadata is retained by the cloud and can be used to find the data objects and containers by performing a query for specific metadata values. The schema for this metadata may be determined by each application, domain, or user.

For more information on support for user metadata, see 16.5.

Storage system metadata is produced/interpreted by the cloud service provider and basic storage functions (e.g., modification and access statistics, access control). For more information on support for storage system metadata, see 16.2.
Data system metadata is interpreted by the cloud service provider as data requirements that control the operation of underlying data services for that data. Depending on the level of granularity supported by the cloud, data system metadata may apply to an aggregation of data objects in a container or to individual data objects, if the cloud service provider supports this level of granularity. For more information on support for data system metadata, see 16.3.

5.1.5 Data and container management

There is no reason that managing data and managing containers should involve different interfaces. Therefore, the use of metadata is extended from applying to individual objects to applying to containers of objects as well. Thus, any data placed into a container inherits the data system metadata of the container into which it was placed. When creating a new container within an existing container, the new container would similarly inherit the metadata settings of its parent’s data system metadata. After an object is created, the data system metadata may be overridden at the container or individual object level, as desired.

Even if the provided interface does not support setting metadata on individual objects, metadata can still be applied to the containers. In such a case, the interface does not provide a mechanism to override metadata that an individual object inherits from its parent container. For file-based interfaces that support extended attributes (e.g., SMB, NFSv4), these extended attributes may be used to specify the data system metadata to override that specified for the container.
5.2 Reference model for cloud storage interfaces

The cloud storage reference model is shown in Fig. 3.

Clients acting in the role of using a data storage interface

Clients can be inside the storage cloud (i.e., providing storage resources to the cloud as well as consuming them) or outside the storage cloud (i.e., only consuming resources).

Clients acting in the role of managing data/storage

This model shows multiple types of cloud data storage interfaces that are able to support both legacy and new applications. All of the interfaces allow storage to be provided on demand, drawn from a pool of resources. The storage capacity is drawn from a pool of storage capacity provided by storage services. The data services are applied to individual objects, as determined by the data system metadata. Metadata specifies the data requirements on the basis of individual objects or for groups of objects (containers).
5.3 Cloud data management interface

The Cloud Data Management Interface (CDMI™) shown in Fig. 3 may be used to create, retrieve, update, and delete objects in a cloud. The features of the CDMI include functions that:

- allow clients to discover the capabilities available by the cloud service provider,
- manage containers and the data that is placed in them, and
- allow metadata to be associated with containers and the objects they contain.

This International Standard divides operations into two types: those that use a CDMI content type in the HTTP body and those that do not. While much of the same data is available via both types, providing both allows for CDMI-aware clients and non-CDMI-aware clients to interact with a CDMI provider.

CDMI can also be used by administrative and management applications to manage containers, domains, security access, and monitoring/billing information, even for storage that is functionally accessible by legacy or proprietary protocols. The capabilities of the underlying storage and data services are exposed so that clients can understand what services the cloud service provider provides.

Conformant cloud service providers may support a subset of the CDMI, as long as they expose the limitations in the capabilities reported via the interface.

This International Standard uses RESTful principles in the interface design where possible (see [7]).

CDMI defines both a means to manage the data as well as a means to store and retrieve the data. The means by which the storage and retrieval of data is achieved is termed a data path. The means by which the data is managed is termed a control path. CDMI specifies both a data path and control path interface.

CDMI does not need to be used as the only data path and is able to manage cloud storage properties for any data path interface (e.g., standardized or vendor specific).

Container metadata is used to configure the data requirements of the storage provided through the exported protocol (e.g., block protocol or file protocol) that the container exposes. When an implementation is based on an underlying file system to store data for a block protocol (e.g., iSCSI), the CDMI container provides a useful abstraction for representing the data system metadata for the data and the structures that govern the exported protocols.

A cloud service may also support domains that allow administrative ownership to be associated with stored objects. Domains allow this International Standard to (among other things):

- determine how user credentials are mapped to principals used in an Access Control List (ACL),
- allow granting of special cloud-related privileges, and
- allow delegation to external user authorization systems (e.g., LDAP or Active Directory).

Domains may also be hierarchical, allowing for corporate domains with multiple children domains for departments or individuals. The domain concept is also used to aggregate usage data that is used to bill, meter, and monitor cloud use.

Finally, capabilities allow a client to discover the capabilities of a CDMI implementation. Requirements throughout this International Standard shall be understood in the context of CDMI capabilities. Mandatory requirements on functionality that is conditioned on a CDMI capability shall not be interpreted to require implementation of that capability, but rather shall be interpreted to apply only to implementations that support the functionality required by that capability.

For example, in 5.3.3, this International Standard states, “Every cloud storage system shall allow object ID-based access to stored objects.” This requirement shall be understood in the context that access by object ID is predicated on the presence of the `cdmi_object_access_by_ID` capability.

5.3.1 Object model for CDMI

The model for CDMI is shown in Fig. 4.

The five types of resources defined are shown in Table 4. The content type in any given operation is specific to each type of resource.
Table 4: Types of resources in the CDMI object model

<table>
<thead>
<tr>
<th>Resource type</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data objects</td>
<td>Data objects are used to store data and associated metadata, and provide functionality similar to files in a file system.</td>
<td>See clause 8.</td>
</tr>
<tr>
<td>Container objects</td>
<td>Container objects have zero or more children objects, and store metadata associated with the container as a whole. Container objects do not store data directly. They provide functionality similar to directories in a file system.</td>
<td>See clause 9.</td>
</tr>
<tr>
<td>Domain objects</td>
<td>Domain objects represent administrative groupings for user authentication and accounting purposes.</td>
<td>See clause 10.</td>
</tr>
<tr>
<td>Queue objects</td>
<td>Queue objects store zero or more pieces of data, and store metadata associated with the queue as a whole. Enqueued values are accessed in a first-in-first-out manner.</td>
<td>See clause 11.</td>
</tr>
<tr>
<td>Capability objects</td>
<td>Capability objects describe the functionality implemented by a CDMI server and are used by a client to discover supported functionality.</td>
<td>See clause 12.</td>
</tr>
</tbody>
</table>

For data storage operations, the client of the interface only needs to know about container objects and data objects. All data path implementations are required to support at least one level of containers (see 5.1.5). Using the CDMI object model (see Fig. 4), the client can send a PUT via CDMI (see Fig. 3) to the new container URI and create a new container with the specified name. Container metadata are optional and are expressed as a series of name-value pairs. After a container is created, a client can send a PUT to create a data object within the newly created container.

Queue objects are also defined (see Fig. 4) and provide in-order-first-in-first-out access to enqueued objects. More information on queues can be found in clause 11.

CDMI defines two namespaces that can be used to access stored objects, a flat object ID namespace and a hierarchical path-based namespace. Support for objects accessed by object ID is indicated by the system-wide capability cdmi_object_access_by_ID, and support for objects accessed by hierarchical path is indicated by the container capability cdmi_create_dataobject found on the root container (and any subcontainers).

Objects are created by ID by performing an HTTP POST against a special URI, designated as /cdmi_objectid/ (see 9.7). Subsequent to creation, objects are modified by performing PUTs using the object ID assigned by the CDMI server, using the "/cdmi_objectid/" URI (see 8.5). The same URI is used to retrieve and delete objects by ID.

Objects are created by name by performing an HTTP PUT to the desired path URI (see 8.3). Subsequent to creation, objects are modified by performing PUTs using the object path specified by the client (see 8.5). The same URI is used to retrieve and delete objects by path.

CDMI defines mechanisms so that objects having only an object ID can be assigned a path location within the hierarchical namespace, and so that objects having both an object ID and path can have their path dropped, such that the object only has an object ID. This function is accomplished by using a “move” modifier to a PUT or POST operation, as shown in Fig. 5.
5.3.2 CDMI metadata

CDMI uses many different types of metadata, including HTTP metadata, data system metadata, user metadata, and storage system metadata.

HTTP metadata is metadata that is related to the use of the HTTP protocol (e.g., Content-Length, Content-Type, etc.). HTTP metadata is not specifically related to this International Standard but needs to be discussed to explain how CDMI uses the HTTP standard.

CDMI data system metadata, user metadata, and storage system metadata is defined in the form of name-value pairs. Vendor-defined data system metadata and storage system metadata names shall begin with the reverse domain name of the vendor.

Data system metadata is metadata that is specified by a CDMI client and is a component of objects. Data system metadata abstractly specifies the data requirements associated with data services that are deployed in the cloud storage system.

User metadata consists of client-defined JSON strings, arrays, and objects that are stored in the metadata field. The namespace used for user metadata names is self-administered (e.g., using the reverse domain name), and user metadata names shall not begin with the prefix "cdmi_".

Storage system metadata is metadata that is generated by the storage services in the system (e.g., creation time, size) to provide useful information to a CDMI client.

The matrix of the creation and consumption of storage system metadata is shown in Table 5.

<table>
<thead>

<td>N/A</td>
</tr>
</tbody>
</table>

5.3.3 CDMI object IDs

Every object stored within a CDMI-compliant system shall have a globally unique object identifier (ID) assigned at creation time. The CDMI object ID is a string with requirements for how it is generated and how it obtains its uniqueness.

Each cloud service that implements CDMI shall generate these identifiers such that the probability of conflicting with identifiers generated by other CDMI Servers and the probability of generating an identifier that has already been used is effectively zero.

Every cloud storage system shall allow object ID-based access to stored objects by allowing the object’s ID to be appended to the root URI (see 5.5.5). If the data object "MyDataObject.txt", stored in the root container "/" with a root path of "/cdmi/2.0.0/", has an object ID of "0006FFD001001CCEB2B4F602032653", the following pair of URIs access the same data object:

- https://cloud.example.com/cdmi/2.0.0/MyDataObject.txt
- https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/0006FFD001001CCEB2B4F602032653

Fig. 5: Object transitions between named and ID-only
If containers are supported, they shall also be accessible by object ID. If the container “MyContainer”, stored in the root container “/” with a root path of “/cdmi/2.0.0/”, has an object ID of “00006FFD0010AA33D8CEF9711E0835CA”, the following pairs of URIs access the same object:

• https://cloud.example.com/cdmi/2.0.0/MyContainer/

• https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/00006FFD0010AA33D8CEF9711E0835CA/

• https://cloud.example.com/cdmi/2.0.0/MyContainer/MyDataObject.txt

• https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/00006FFD0010AA33D8CEF9711E0835CA/MyDataObject.txt

5.3.4 CDMI object ID format

The CDMI Server shall create the object ID, which identifies an object. The object ID shall be globally unique and shall conform to the format defined in Table 6. The native format of an object ID is a variable-length byte sequence and shall be a maximum length of 40 bytes. A client should treat object IDs as opaque byte strings. However, the object ID format is defined such that its integrity may be validated, and independent CDMI Servers may assign unique object ID values independently.

<table>
<thead>
<tr>
<th>Table 6: Object ID format</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
<tr>
<td>Reserved (zero)</td>
</tr>
</tbody>
</table>

The fields shown in Table 6 are defined as follows:

- The reserved bytes shall be set to zero.
- The Enterprise Number field shall be the SNMP enterprise number of the offering organization that developed the system that created the object ID, in network byte order. See RFC 2578 [21] and https://www.iana.org/assignments/enterprise-numbers. 0 is a reserved value.
- The byte at offset 5 shall contain the full length of the object ID, in bytes.
- The CRC field shall contain a 2-byte (16-bit) CRC in network byte order. The CRC field enables the object ID to be validated for integrity. The CRC field shall be generated by running the CRC algorithm across all bytes of the object ID, as defined by the Length field, with the CRC field set to zero. The CRC function shall have the following fields:
  - Name : “CRC-16”,
  - Width : 16,
  - Poly : 0x8005,
  - Init : 0x0000,
  - RefIn : True,
  - RefOut : True,
  - XorOut : 0x0000, and
  - Check : 0xBB3D.

  This function defines a 16-bit CRC with polynomial 0x8005, reflected input, and reflected output.
- Opaque data in each object ID shall be unique for a given Enterprise Number.

The native format for an object ID is binary. When necessary, such as when included in URIs and JSON strings, the object ID textual representation shall be encoded using Base16 encoding rules described in RFC 4648 [19] and shall be case insensitive.
5.4 Security

5.4.1 Security objectives

Security, in the context of CDMI, refers to the protective measures employed in managing and accessing data and storage. The specific objectives to be addressed by security include providing a mechanism that:

- assures that the communications between a CDMI client and server cannot be read or modified by a third party;
- allows CDMI clients and servers to assure their identity;
- allows control of the actions a CDMI client is permitted to perform on a CDMI server;
- allows records to be generated for actions performed by a CDMI client on a CDMI server;
- protects data at rest;
- eliminates data in a controlled manner; and
- discovers the security capabilities of a particular implementation.

Security measures within CDMI are summarized as:

- transport security,
- user and entity authentication,
- authorization and access controls,
- data integrity,
- data and media sanitization,
- data retention,
- protections against malware,
- data at-rest encryption, and
- security capabilities.

With the exception of both the transport security and the security capabilities, which shall be implemented, the security measures can vary significantly from implementation to implementation.

When security is a concern, the CDMI client should begin with a series of security capability lookups (see 12.2.7 to determine the exact nature of the security features that are available. Based on the values of these capabilities, a risk-based decision should be made as to whether the CDMI server should be used. This is particularly true when the data to be stored in the cloud storage is sensitive or regulated in a way that requires stored data to be protected (e.g., encrypted) or handled in a particular manner (e.g., full accountability and traceability of management and access).

5.4.2 HTTP security

HTTP is the mandatory transport mechanism for this version of CDMI. It is important to note that HTTP, by itself, offers no confidentiality or integrity protections. As CDMI is built on top of HTTP, HTTP over Transport Layer Security (TLS) (i.e., HTTPS) is the mechanism that is used to secure the communications between CDMI clients and servers.

To ensure both security and interoperability, all CDMI implementations:

- shall implement the TLS protocol as described in the latest version of the “SNIA TLS Specification for Storage Systems” [42]; with a six-month transition period for implementations. The TLS specification is updated when new vulnerabilities are found, and CDMI implementations shall support the latest specification within six months of its publication announcement;
- shall support both HTTP over TLS and HTTP without TLS; and
- shall allow HTTP without TLS to be disabled.

When TLS is used to secure HTTP, the client and server typically perform some form of entity authentication. However, the specific nature of this entity authentication depends on the cipher suite negotiated; a cipher suite specifies the encryption algorithm and digest algorithm to use on a TLS connection. A very common scenario involves using server-side certificates, which the client trusts, as the basis for unidirectional entity authentication. It is possible that mutual authentication involving both client-side and server-side certificates are required.
5.4.3 Client Authentication

A CDMI client shall comply with all security requirements for HTTP that apply to clients. CDMI clients shall be responsible for initiating user authentication for each CDMI operation that is performed. The CDMI server functions as the authenticator and receives and validates authentication credentials from the client. RFC 2616 [23] and RFC 2617 [8] define requirements for HTTP authentication, which generally starts with an HTTP client request. If the client request does not include an Authorization header and authentication is required, the server responds with an HTTP status code of 401 Unauthorized and a WWW-Authenticate response header. The HTTP client shall then respond with the appropriate Authorization header in a subsequent request. The format of the WWW-Authenticate and Authorization headers varies depending on the type of authentication required.

- HTTP basic authentication involves sending the user name and password in the clear, and it should only be used on a secure network or in conjunction with TLS.
- HTTP digest authentication sends a secure digest of the user name and password (and other information such as a nonce value), and can be used on an insecure network without TLS.
- HTTP status codes of 401 Unauthorized should not include a choice of authentication.
- HTTP basic authentication and/or HTTP digest authentication should be implemented.
- Authentication credentials used with one type of HTTP authentication (i.e., basic or digest) should never be subsequently used with the other type of HTTP authentication.

Once a user is authenticated, the provided principal name shall be mapped by the CDMI domain to a domain user (or used directly as the ACE “who” if domains are not supported). This mapping is then used to determine authorization. A CDMI server typically relies on an authentication service (local and/or external) to validate client credentials. Differing authentication schemes may be supported, including host-based authentication, Kerberos, PKI, or other; the authentication service is beyond the scope of this International Standard.

5.4.4 Use of TLS and HTTP

Recommendations for using HTTP and TLS are as follows:

- A client connecting to a CDMI server using TLS should use TCP port 443, and a client connecting without TLS should use TCP port 80.
- A client that fails to connect to a CDMI server on port 443 should retry without TLS on TCP port 80 if their security policy allows it.
- Servers may respond to HTTP requests on port 80 with an HTTP REDIRECT to the appropriate TLS URI (using port 443). Clients should honor such redirects in this situation.

5.4.5 Further information

For further information pertaining to storage security techniques, see the latest version of ISO 20648.
5.5 Required HTTP support

5.5.1 RFC 2616 support requirements

A conformant implementation of CDMI shall also be a conformant implementation of RFC 2616 [23] (i.e., HTTP 1.1). The subclauses below list the sections of RFC 2616 [23] that shall be supported; however, this list is not comprehensive.

5.5.2 Content-Type negotiation

For CDMI operations, media types for CDMI objects are used as defined in RFC 6208 [26]. All CDMI representations follow the rules established for application/json as defined in RFC 4627 [5]. The use of the CDMI media types with the +json suffix shall be supported as defined in RFC 6839 [11].

A client can optionally supply an HTTP Accept header, as per section 14.1 of RFC 2616 [23]. If a client is restricting the response to a specific CDMI media type, the corresponding media type shall be specified in the Accept header. Otherwise, the Accept header can contain "*/" or a list of media types, or it may be omitted.

If a request body is present, the client shall include a Content-Type header, as per section 14.17 of RFC 2616 [23]. If the client does not provide a Content-Type header when required or provides a media type in the Content-Type header that does not match with the existing resource media type, the server shall return an HTTP status code of 400 Bad Request.

If a response body is present, the server shall provide a Content-Type header.

This International Standard may further qualify content negotiation (e.g., in 9.4, the absence of a Content-Type header has a specific meaning).

5.5.3 Range support

The server shall support HTTP Range headers and partial content responses (see Section 14.16 of RFC 2616 [23]).

The values of the childrange, valuerange and queuerange fields are formatted based on the HTTP byte-range-resp-spec, as defined in clause 14.16 of RFC 2616 [23].

5.5.4 URI escaping

Percent escaping of reserved characters specified in RFC 3986 [2] shall be applied to all text strings used in HTTP request URIs and HTTP header URIs. This includes user-supplied field names, metadata names, data object names, container object names, queue object names, and domain object names when used in HTTP request URIs and HTTP header URIs.

Field names and values shall not be escaped when stored and when sent in request body and response bodies.

A client retrieving a metadata item named "@user" from a container object with the name of "@MyContainer" would perform the following request and reply:

```plaintext
--> GET /cdmi/2.0.0/%40MyContainer/?objectName&metadata=%40user HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-container
<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-container
<--
<-- |
<-- "objectName": "@MyContainer/",
<-- "metadata": |
<-- "@user": "test",
<-- ...
<-- }
<-- }
```
5.5.5 Use of URIs

The format and syntax of URIs are defined by RFC 3986 [2]. This International Standard splits the RFC 3986 path into two parts: The "root path" and the "CDMI path", as shown in Fig. 6. The URI containing only the root path is called the "root URI".

```
https://example.com:443/cdmi/2.0.0/myContainer/myDataObject?value
```

<table>
<thead>
<tr>
<th>scheme</th>
<th>authority</th>
<th>root path</th>
<th>CDMI path</th>
<th>query</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Fig. 6: CDMI URI Components

The container at the start of the CDMI path is the root container. For example, in Fig. 6, the root container is named "myContainer".

All URIs in this International Standard are relative to the root URI unless otherwise noted. As a consequence, the algorithm used for calculating the resolved URI is as described in Section 5.2 of RFC 3986 [2]. Every CDMI client shall maintain one or more root URIs that each correspond to a root CDMI container on the CDMI server. Since all URIs to CDMI containers end in a trailing slash, all root URIs will end in a trailing slash.

This International Standard places no additional restrictions on root URIs beyond those specified for the "path component" in RFC 3986.

Industry conventions for RESTful APIs suggest root URIs end in "/cdmi/<version>/", where <version> is in the form of "<major>.<minor>.<micro>", where <major>, <minor> and <micro> are integers indicating the version of the CDMI interface specification. All examples in this specification use a root URI of https://cloud.example.com/cdmi/2.0.0/.

The properties of the root URI determine the parentID and parentURI fields of an root CDMI container:

- If the root path is "/", the root container shall not include the parentID field and shall populate an empty string ("") for the value of the parentURI field.
- If the root path is not "/" and the last entity in the root path is a CDMI container, the root container shall populate parentID field with the CDMI object ID of the CDMI container corresponding to the parent path entity, and shall populate parentURI field with the URI of the parent path.
- If the root path is not "/" and the last entity in the root path is not a CDMI container, the root container shall not include the parentID field, and shall populate parentURI field with the URI of the parent path.
- If the root path is not "/" and the last entry in the root path is not accessible via the scheme, root container may omit the parentID field and may populate parentURI field with an empty string ("").

Table 7 shows how CDMI paths (relative URIs) are resolved with root URIs.
### Table 7: Relative URIs resolved against root URIs

<td><a href="https://cloud.example.com/cdmi/2.0.0/myCDMIcontainer/testObject">https://cloud.example.com/cdmi/2.0.0/myCDMIcontainer/testObject</a></td>
</tr>
</tbody>
</table>

#### 5.5.6 Reserved characters

The name of CDMI data objects, container objects, queue objects, domain objects and capability objects shall not contain the "/" or "?" characters, as these characters are reserved for delimiters.
5.6 Time representations

Unless otherwise specified, all date/time values are in the ISO 8601:2004 extended representation ("YYYY-MM-DDTh:mm:ss.ssssssZ"). The full precision shall be specified, the sub-second separator shall be a ".", the "Z" UTC zone indicator shall be included, and all timestamps shall be in UTC time zone. The "YYYY-MM-DDT24:00:00.000000Z" hour shall not be used, and instead, it shall be represented as "YYYY-MM-DDT00:00.000000Z".

Unless otherwise specified, all date/time intervals are in the ISO 8601:2004 start date/end date representation ("YYYY-MM-DDTh:mm:ss.ssssssZ/YYYY-MM-DDTh:mm:ss.ssssssZ"). The end date shall be equal to or later than the start date. The full precision shall be specified, the sub-second separator shall be a ".", the "Z" UTC zone indicator shall be included, and all timestamps shall be in UTC time zone. The "YYYY-MM-DDT24:00:00.000000Z" hour shall not be used, and instead, it shall be represented as "YYYY-MM-DDT00:00.000000Z".
5.7 Backwards compatibility

CDMI client and server implementations shall implement the following measures to ensure backwards compatibility with earlier versions of this International Standard.

See the CDMI 1.1.1 Specification for details on backwards compatibility specific to the 1.x versions of CDMI.

5.7.1 Specification version detection

CDMI 2.x clients shall not include the X-CDMI-Specification-Version custom header. When a CDMI 2.x client performs an operation against a CDMI 1.x Server, the absence of this header shall result in an error response from the CDMI 1.x server. The client may use the presence of the X-CDMI-Specification-Version header in an error response as an indication to use CDMI 1.x (which mandates the use of this custom header), if supported.

CDMI 2.x servers may use the presence of the X-CDMI-Specification-Version custom header from a CDMI 1.x client as an indication to use CDMI 1.x, if supported.

5.7.2 JSON value transfer encoding

CDMI 2.x servers may support the “json” value transfer encoding. When a CDMI server supports both CDMI 2.x and CDMI 1.x, data objects with a value transfer encoding of json shall be made accessible to CDMI 1.x clients using a value transfer encoding of UTF-8, with the server adding in the required escaping.
5.8 Object references

Object references are URIs within the cloud storage namespace that redirect to another URI within the same or another cloud storage namespace. References are similar to soft links in a file system. The cloud does not guarantee that the referenced URI will be valid after the time of creation.

References are visible as children in a container and are distinguished from non-references in container children listings by the presence of a trailing “?” character added to the reference name. Performing an operation (with the exception of create or delete) to a reference URI will result in an HTTP status code of 302 Found, with the HTTP Location header containing the absolute redirect destination URI that was specified at the time the reference was created. The reference’s destination URI shall not be changed after a reference has been created.

To continue, when CDMI clients receive an HTTP status code of 302 Found, they should retry the operation using the URI contained within the "Location" header.

A delete operation on a reference URI shall delete the reference. References cannot be updated. To update the destination of a redirect, the client shall first delete the reference and then create a new reference to the desired destination.

EXAMPLE 1: GET to a URI, where the URI is a reference:

```
--> GET /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object
<-- HTTP/1.1 302 Found
<-- Location: https://cloud.example.com/cdmi/2.0.0/MyContainer/MyOtherDataObject.txt
```

References by object ID shall always redirect to a URI that ends with the same object ID as the request URI.

EXAMPLE 2: GET to an object ID URI, where the URI is a reference:

```
--> GET /cdmi/2.0.0/cdmi_objectid/00006FFD0010AA33D8CEF9711E0835CA HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object
<-- HTTP/1.1 302 Found
<-- Location: https://archive.example.com/cdmi/2.0.0/cdmi_objectid/00006FFD0010AA33D8CEF9711E0835CA
```

EXAMPLE 3: PUT to create a reference:

```
--> PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com Accept: application/cdmi-object
--> Content-Type: application/cdmi-object
<--
<-- {  
<-- "reference": "https://cloud.example.com/cdmi/2.0.0/MyContainer/MyOtherDataObject.txt"  
<-- }
<-- HTTP/1.1 201 Created
```
EXAMPLE 4: POST to create a reference:

```
--> POST /cdmi/2.0.0/cdmi_objectid/ HTTP/1.1
--> Host: cloud.example.com Accept: application/cdmi-object
--> Content-Type: application/cdmi-object
-->
--> {  
--> "reference": "https://cloud.example.com/cdmi/2.0.0/MyContainer/MyOtherDataObject.txt"

-->
```

<-- HTTP/1.1 201 Created
<-- Location: https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/00007ED90010DF417BAD70A0C7F5CDDA

EXAMPLE 5: DELETE to delete a reference:

```
--> DELETE /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com

<-- HTTP/1.1 204 No Content
Part II

Basic Cloud Storage
**Clause 6**

**Data Object Resource Operations using HTTP**

### 6.1 Overview

Data objects are the fundamental storage components within CDMI™, and is analogous to files in a file system.

As CDMI builds on top of, and is compatible with, the HTTP standard (RFC 2616 [23]), this allows unmodified HTTP clients to communicate with a CDMI server. This also allows CDMI operations to coexist with other HTTP-based storage protocols, such as WebDAV, S3, and OpenStack Swift.

A CDMI server differentiates between HTTP and CDMI operations using the standard Content-Type and Accept headers. When CDMI MIME types defined in RFC 6208 [26] are used in these headers, this indicates that CDMI behaviors, as described in clause 8, are used in addition to the standard HTTP behaviors.

In CDMI 1.0.2, basic HTTP operations were described as “Non-CDMI” operations to distinguish them from operations using CDMI MIME types.

A CDMI implementation that supports data objects shall include support for basic data object HTTP operations corresponding with the CDMI capabilities that are published by the implementation. Capabilities allow a client to discover which operations (such as create, update, delete, etc.) are supported and are described in clause 9.

Ciphertext representation of encrypted objects are created, accessed, and updated by explicitly specifying a MIME type "application/cms" or "application/jose+json". Otherwise, a plaintext representation is created, accessed, and updated. For more details on encrypted updates, see clause 23.
6.2 Create a data object using HTTP

6.2.1 Synopsis

The following HTTP PUT operation creates a new data object in the specified container:

```
• PUT <root URI>/<ContainerName>/<DataObjectName>
```

Where:

- `<root URI>` is the path to the CDMI cloud.
- `<ContainerName>` is zero or more intermediate containers that already exist, with one slash (i.e., "/") between each pair of container names.
- `<DataObjectName>` is the name specified for the data object to be created.

After it is created, the data object shall also be accessible at `<root URI>/cdmi_objectid/<objectID>`.

6.2.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 8.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_create_dataobject</td>
<td>Parent Container</td>
<td>Ability to create a new data object</td>
</tr>
<tr>
<td>cdmi_create_value_range</td>
<td>System Wide Capability</td>
<td>Ability to create a data object using a specified byte range</td>
</tr>
</tbody>
</table>

6.2.3 Request headers

The HTTP request headers for creating a CDMI data object using HTTP are shown in Table 9.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| Content-Type        | Header string | The content type of the data to be stored as a data object. The value specified in this header shall be converted to lower case and stored in the mimetype field of the CDMI data object.  
|                     |               | - If the Content-Type header includes the charset parameter as defined in RFC 2616 [23] of "utf-8" (e.g., ";charset=utf-8"), the valueTransferEncoding field of the CDMI data object shall be set to "utf-8". 
|                     |               | Otherwise, the valueTransferEncoding field of the CDMI data object shall be set to "base64".  
|                     |               | - If not specified, the mimetype field shall be set to "application/octet-stream". | Optional    |
| X-CDMI-Partial      | Header String | Indicates that the newly created object is part of a series of writes and has not yet been fully created. When set to "true", the completionStatus field shall be set to "Processing". X-CDMI-Partial works across CDMI and non-CDMI operations. | Optional    |
| Content-Range       | Header String | A valid ranges-specifier (see RFC 2616 [23] Section 14.35.1) | Optional    |

6.2.4 Request message body

The request message body contains the data to be stored in the value of the data object.
6.2.5 Response headers

No response headers are specified.

6.2.6 Response message body

No response message body fields are specified.

6.2.7 Response status

The HTTP status codes that occur when creating a data object using HTTP are described in Table 10.

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201 Created</td>
<td>The new data object was created.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

6.2.8 Examples

EXAMPLE 1: PUT to the container URI the data object name and contents.

```plaintext
--> PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: text/plain;charset=utf-8
--> Content-Length: 37
-->
--> This is the Value of this Data Object
<-- HTTP/1.1 201 Created
```

EXAMPLE 2: Put to the container URI to create an encrypted object:

```plaintext
--> PUT /cdmi/2.0.0/MyContainer/MyEncryptedObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cms
--> Content-Length: 1425
-->
<-- CMS Encrypted Object
<-- HTTP/1.1 201 Created
```

EXAMPLE 3: PUT to the container URI to create an encrypted object:
6.3 Read a data object using HTTP

6.3.1 Synopsis

The following HTTP GET operations read from an existing data object at the specified URI:

- GET <root URI>/<ContainerName>/<DataObjectName>
- GET <root URI>/cdmi_objectid/<DataObjectID>

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers.
- <DataObjectName> is the name of the data object to be read from.
- <DataObjectID> is the ID of the data object to be read from.

6.3.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 11.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_read_value</td>
<td>Data Object</td>
<td>Ability to read the value of an existing data object</td>
</tr>
<tr>
<td>cdmi_read_value_range</td>
<td>Data Object</td>
<td>Ability to read a sub-range of the value of an existing data object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System Wide Capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

6.3.3 Request header

The HTTP request header for reading a CDMI data object using HTTP is shown in Table 12.
Table 12: Request header - Read a CDMI data object using HTTP

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>Header string</td>
<td>A valid ranges-specifier (see RFC 2616 [23] Section 14.35.1)</td>
<td>Optional</td>
</tr>
</tbody>
</table>
| Accept   | Header string| **"/* or a value as described in: 5.5.2.**
• If the object has a mimetype of "application/cms" or "application/jose+json", and the mimetype "application/cms" or "application/jose+json" is included in the Accept header mimetype, the CDMI server shall return the CMS or JOSE value in the response message body.
• Otherwise, the decrypted plaintext shall be returned in the response message body, along with the encapsulated mimetype in the Content-Type response header. If decryption is not possible, an error result code shall be returned. (See clause 23 – Encrypted Objects)
• If the Accept header mimetype list includes "\*/\*" before "application/cms" and/or "application/jose+json", the server will first try to return the decrypted plaintext, and shall return the CMS or JOSE value when decryption fails.
• If the Accept header mimetype list excludes "\*/\*", decrypted plaintext shall only be returned if the encapsulated mimetype is included in the Accept header mimetype list. | Optional    |

6.3.4 Request message body

A request body shall not be provided.

6.3.5 Response headers

The HTTP response headers for reading a data object using HTTP are shown in Table 13.

Table 13: Response headers - Read a CDMI Data Object using HTTP

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>The content type returned shall be the mimetype field in the data object.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Location</td>
<td>Header string</td>
<td>The server shall respond with the URI that the reference redirects to if the object is a reference.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

6.3.6 Response message body

When reading a data object using HTTP, the following applies:

• The response message body shall be the contents of the data object’s value field.
• When reading a value, zeros shall be returned for any gaps resulting from non-contiguous writes.

6.3.7 Response status

The HTTP status codes that occur when reading a data object using HTTP are described in Table 14.
Table 14: HTTP status codes - Read a CDMI data object using HTTP

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 OK</td>
<td>The data object content was returned in the response.</td>
</tr>
<tr>
<td>206 Partial Content</td>
<td>A requested range of the data object content was returned in the response.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI, or a requested field within the resource was not found.</td>
</tr>
</tbody>
</table>

6.3.8 Examples

EXAMPLE 1: GET to the data object URI to read the value of the data object:

```plaintext
---> GET /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
---> Host: cloud.example.com
<-- HTTP/1.1 200 OK
<-- Content-Type: text/plain
<-- Content-Length: 37
<--
<-- This is the value of this data object
```

EXAMPLE 2: GET to the data object URI to read the first 11 bytes of the value of the data object:

```plaintext
---> GET /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
---> Host: cloud.example.com
---> Range: bytes=0-10
<-- HTTP/1.1 206 Partial Content
<-- Content-Type: text/plain
<-- Content-Range: bytes 0-10/37
<-- Content-Length: 11
<--
<-- This is the value of this data object
```

EXAMPLE 3: GET to the data object URI to always return the ciphertext of an encrypted object:

```plaintext
---> GET /cdmi/2.0.0/MyContainer/MyEncryptedObject.txt HTTP/1.1
---> Host: cloud.example.com
---> Accept: application/cms, application/jose+json
<-- HTTP/1.1 200 OK
<-- Content-Type: application/cms
<-- Content-Length: 1425
<--
<-- <CMS Encrypted Object>
```

EXAMPLE 4: GET to the data object URI to read the plaintext of an encrypted object, if possible; otherwise, get the ciphertext:

```plaintext
---> GET /cdmi/2.0.0/MyContainer/MyEncryptedObject.txt HTTP/1.1
---> Host: cloud.example.com
---> Accept: */*, application/cms, application/jose+json
---> <Header credentials used to authenticate and access the decryptionkey>
<-- HTTP/1.1 200 OK
<-- Content-Type: text/plain
<-- Content-Length: 252
<--
<-- <Decrypted contents of Encrypted Value>
```

EXAMPLE 5: GET to the data object URI to read the plaintext of an encrypted object:
--> GET /cdmi/2.0.0/MyContainer/MyEncryptedObject.txt HTTP/1.1
--> Host: cloud.example.com
--> <Header credentials used to authenticate and access the decryption key>

<-- HTTP/1.1 200 OK
<-- Content-Type: text/plain
<-- Content-Length: 252
<--
<-- <Decrypted contents of Encrypted Value>
6.4 Update a data object using HTTP

6.4.1 Synopsis

The following HTTP PATCH operation updates an existing data object at the specified URI:

- PATCH <root URI>/<ContainerName>/<DataObjectName>
- PATCH <root URI>/cdmi_objectid/<DataObjectID>

Where:
- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers.
- <DataObjectName> is the name of the data object to be updated.
- <DataObjectID> is the ID of the data object to be read from.

6.4.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 15.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_modify_value</td>
<td>Data Object</td>
<td>Ability to modify the value of an existing data object</td>
</tr>
<tr>
<td>cdmi_modify_value_range</td>
<td>Data Object</td>
<td>Ability to modify a sub-range of the value of an existing data object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System Wide Capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

6.4.3 Request headers

The HTTP request headers for updating a CDMI data object using HTTP are shown in Table 16.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>The content type of the data to be stored as a data object. The value specified in this header shall be converted to lower case and stored in the mimetype field of the CDMI data object.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>string</td>
<td>• If the Content-Type header includes the charset parameter as defined in RFC 2616 [23] of &quot;utf-8 (e.g., ;charset=utf-8)&quot;, the valuetransferencoding field of the CDMI data object shall be set to &quot;utf-8&quot;. Otherwise, the valuetransferencoding field of the CDMI data object shall be set to &quot;base64&quot;.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If not specified, the existing mimetype field value shall be preserved.</td>
<td>Optional</td>
</tr>
<tr>
<td>Content-Range</td>
<td>Header</td>
<td>A valid ranges-specifier (see RFC 2616 [23] Section 14.35.1)</td>
<td>Optional</td>
</tr>
</tbody>
</table>
Table 16 – continued from previous page

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>X-CDMI-Partial</td>
<td>Header</td>
<td>Indicates that the operation is part of a series of updates and has not yet been fully created. When set to &quot;true&quot;, the completionStatus field shall be set to &quot;Processing&quot;. X-CDMI-Partial works across CDMI and non-CDMI operations. If the completionStatus field had previously been set to &quot;Processing&quot; by including this header in a create or update, the next update without this field shall change the completionStatus field back to &quot;Complete&quot;.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

6.4.4 Request message body

The request message body contains the data to be stored in the value of the data object.

6.4.5 Response header

The HTTP response header for updating a data object using HTTP is shown in Table 17.

Table 17: Response header - Update a CDMI data object using HTTP

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>Header</td>
<td>The server shall respond with the URI to which the reference redirects if the object is a reference.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

6.4.6 Response message body

A response body may be provided as per RFC 2616 [23].

6.4.7 Response status

The HTTP status codes that occur when updating a data object using HTTP are described in Table 18.

Table 18: HTTP status codes - Update a CDMI data object using HTTP

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The data object content was returned in the response.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

6.4.8 Examples

EXAMPLE 1: PATCH to the data object URI to update the value of the data object:
EXAMPLE 2: PATCH to the data object URI to update four bytes within the value of the data object:

```http
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Range: bytes 21-24/37
--> Content-Type: text/plain
--> Content-Length: 4
-->
--> that

<-- HTTP/1.1 204 No Content
```
6.5 Delete a data object using HTTP

6.5.1 Synopsis

The following HTTP DELETE operations delete an existing data object at the specified URI:

- DELETE <root URI>/<ContainerName>/<DataObjectName>
- DELETE <root URI>/cdmi_objectid/<DataObjectID>

Where:

- `<root URI>` is the path to the CDMI cloud.
- `<ContainerName>` is zero or more intermediate containers.
- `<DataObjectName>` is the name of the data object to be deleted.
- `<DataObjectID>` is the ID of the data object to be deleted.

6.5.2 Capability

Capabilities that indicate which operations are supported are shown in Table 19.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_delete_dataobject</td>
<td>Data Object</td>
<td>Ability to delete an existing data object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System Wide Capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

6.5.3 Request headers

Request headers may be provided as per RFC 2616 [23].

6.5.4 Request message body

A request body may be provided as per RFC 2616 [23].

6.5.5 Response headers

Response headers may be provided as per RFC 2616 [23].

6.5.6 Response message body

A response body may be provided as per RFC 2616 [23].

6.5.7 Response status

Table 20 describes the HTTP status codes that occur when deleting a data object using HTTP.
Table 20: HTTP status codes - Delete a CDMI data object using HTTP

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The data object was successfully deleted.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>

<td>The operation conflicts with a non-CDMI access protocol lock, has caused a</td>
</tr>
<tr>
<td></td>
<td>state transition error on the server, or the data object cannot be deleted.</td>
</tr>
</tbody>
</table>

6.5.8 Example

EXAMPLE 1: DELETE to the data object URI:

```plaintext
--> DELETE /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```
Clause 7

Container Object Resource Operations using HTTP

7.1 Overview

Container objects are the fundamental grouping mechanism for stored data within CDMI, and is analogous to directories in a file system. Each container object has zero or more child objects.

Following the URI conventions for hierarchical paths, container URIs shall consist of one or more container names that are separated by forward slashes ("/") and that end with a forward slash ("/").

As basic HTTP operations do not use the CDMI MIME types that distinguish data object operations from container object operations, a CDMI implementation shall use the presence or absence of a forward slash at the end of a URI to distinguish between a container object create or a data object create, respectively.

If a basic HTTP read, update, or delete operation is performed against an existing container resource and the trailing slash at the end of the URI is omitted, the server shall respond with an HTTP status code of 301 Moved Permanently. In addition, a Location header containing the URI with the trailing slash added shall be returned.

A CDMI server differentiates between HTTP and CDMI operations using the standard Content-Type and Accept headers. When CDMI MIME types defined in RFC 6208 [26] are used in these headers, this indicates that CDMI behaviors, as described in Clause 9 are used in addition to the standard HTTP behaviors.

A CDMI implementation that supports container objects shall include support for basic container object HTTP operations corresponding with the CDMI capabilities that are published by the implementation. Capabilities allow a client to discover which operations (such as create, update, delete, etc.) are supported and are described in Clause 12.
7.2 Create a container object using HTTP

7.2.1 Synopsis

To create a new container object, the following request shall be performed:

```
• PUT <root URI>/<ContainerName>/<ContainerObjectName>/
```

Where:

```
• <root URI> is the path to the CDMI cloud.
• <ContainerName> is zero or more intermediate container objects that already exist, with one slash (i.e., "/") between each pair of container object names.
• <ContainerObjectName> is the name specified for the container object to be created.
```

After it is created, the container object shall also be accessible at <root URI>/cdmi_objectid/<objectID>/.

The presence of a trailing slash at the end of the HTTP PUT URI indicates that a container object is being created and distinguishes it from a request to create a data object.

7.2.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 21.

Table 21: Capabilities - Create a CDMI container object using HTTP

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_create_container</td>
<td>Parent Container</td>
<td>Ability to create a new data object</td>
</tr>
</tbody>
</table>

7.2.3 Request headers

Request headers can be provided as per RFC 2616 [23].

7.2.4 Request message body

A request body shall not be provided.

7.2.5 Response headers

Response headers can be provided as per RFC 2616 [23].

7.2.6 Response message body

A response body can be provided as per RFC 2616 [23].

7.2.7 Response status

Table 22 describes the HTTP status codes that occur when creating a container object using HTTP.
### Table 22: HTTP status codes - Create a container object using HTTP

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201 Created</td>
<td>The new container object was created.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

### 7.2.8 Example

**EXAMPLE 1:** PUT to the URI the container object name:

```
--> PUT /cdmi/2.0.0/MyContainer/ HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 201 Created
```
### 7.3 Read a container object using HTTP

Reading a container object using HTTP is not defined by this version of this International Standard. A server is allowed to implement responses such as an Apache directory listing or an S3-style bucket listing.

To read a container object using CDMI, see §9.4.
7.4 Update a container object using HTTP

Updating a container object using HTTP is not defined by this version of this International Standard.

To update a container object using CDMI, see 9.5.
7.5 Delete a container object using HTTP

7.5.1 Synopsis

The following HTTP DELETE operations delete an existing container object at the specified URI, including all contained children and snapshots:

- DELETE <root URI>/<ContainerName>/<ContainerObjectName>/
- DELETE <root URI>/cdmi_objectid/<ContainerObjectID>

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate container objects.
- <ContainerObjectName> is the name of the container object to be deleted.
- <ContainerObjectID> is the ID of the container object to be deleted.

7.5.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 23.

Table 23: Capabilities - Delete a CDMI container object using HTTP

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_delete_container</td>
<td>Parent Container</td>
<td>Ability to delete an existing container object</td>

<tr>
<td>cdmi_object_access_by_ID</td>
<td>System Wide</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

7.5.3 Request headers

Request headers can be provided as per RFC 2616 [23].

7.5.4 Request message body

A request body can be provided as per RFC 2616 [23].

7.5.5 Response headers

Response headers can be provided as per RFC 2616 [23].

7.5.6 Response message body

A response body can be provided as per RFC 2616 [23].

7.5.7 Response status

Table 24 describes the HTTP status codes that occur when deleting a container object using HTTP.
Table 24: HTTP status codes - Delete a CDMI container object using HTTP

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The container object was successfully deleted.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

7.5.8 Example

EXAMPLE 1: DELETE to the container object URI:

```plaintext
--> DELETE /cdmi/2.0.0/MyContainer/ HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```
7.6 Create (POST) a new data object using HTTP

7.6.1 Synopsis

To create a new data object in a specified container where the name of the data object is a server-assigned object identifier, the following request shall be performed:

```
POST <root URI>/<ContainerName>/
```

Where:

- `<root URI>` is the path to the CDMI cloud.
- `<ContainerName>` is zero or more intermediate container objects that already exist, with one slash (i.e., “/”) between each pair of container object names.

The data object shall be accessible as a child of the container with a server-assigned name and shall also be accessible at `<root URI>/cdmi_objectid/<objectID>`.

HTTP POST to a container is used to enable CDMI servers to support RFC 1867 form-based file uploading. When implementing RFC 1867, the CDMI server-assigned name may be set to, or derived from, the user-provided file name.

7.6.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 25.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cDMI_create_dataobject</td>
<td>Parent Container</td>
<td>Ability to create a new data object</td>
</tr>
<tr>
<td>cDMI_post_dataobject</td>
<td>System Wide</td>
<td>Ability to create a data object in “/cdmi_objectid/“</td>
</tr>
<tr>
<td>cDMI_create_value_range</td>
<td>System Wide</td>
<td>Ability to create a data object using a specified byte range</td>
</tr>
<tr>
<td>cDMI_create_value_range_by_ID</td>
<td>System Wide</td>
<td>Ability to create a data object in “/cdmi_objectid/“ using a specified byte range</td>
</tr>
<tr>
<td>cDMI_multipart_mime</td>
<td>System Wide</td>
<td>Ability to create a data object using multi-part MIME</td>
</tr>
</tbody>
</table>

7.6.3 Request headers

The HTTP request header for creating a new CDMI data object using HTTP is shown in Table 26.
Table 26: Request header - Create a new data object using HTTP

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>The content type of the data to be stored as a data object. The value specified here shall be converted to lower case and stored in the mimetype field of the CDMI data object.</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>String</td>
<td>• If the content type includes the charset parameter as defined in RFC 2616 [23] of &quot;utf-8&quot; (e.g., &quot;;charset=utf-8&quot;), the valuetransferencoding field of the CDMI data object shall be set to &quot;utf-8&quot;. Otherwise, the valuetransferencoding field of the CDMI data object shall be set to &quot;base64&quot;. • If not specified, the mimetype field shall be set to &quot;application/octet-stream&quot;.</td>
<td></td>
</tr>
<tr>
<td>X-CDMI-Partial</td>
<td>Header</td>
<td>Indicates that the newly created object is part of a series of writes and has not yet been fully created. When set to &quot;true&quot;, the completionStatus field shall be set to &quot;Processing&quot;. X-CDMI-Partial works across CDMI and non-CDMI operations.</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>String</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

7.6.4 Request message body

The message body shall contain the contents (value) of the data object to be created.

7.6.5 Response headers

The HTTP response header for creating a new CDMI data object using HTTP is shown in Table 27.

Table 27: Response header - Create a new data object using HTTP

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>Header</td>
<td>The unique absolute URI for the new data object as assigned by the system. In the absence of file name information from the client, the system shall assign the URI in the form: <a href="http://host:port/">http://host:port/</a>&lt;root URI&gt;/&lt;ContainerName&gt;/&lt;ObjectID&gt; or <a href="https://host:port/">https://host:port/</a>&lt;root URI&gt;/&lt;ContainerName&gt;/&lt;ObjectID&gt;.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

7.6.6 Response message body

A response body can be provided as per RFC 2616 [23].

7.6.7 Response status

Table 28 describes the HTTP status codes that occur when creating a new data object using HTTP.

Table 28: HTTP status codes - Create a new data object using HTTP

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201 Created</td>
<td>The new data object was created.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
</tbody>
</table>
7.6.8 Examples

EXAMPLE 1: POST to the container object URI the data object contents:

```plaintext
--> POST /cdmi/2.0.0/MyContainer/ HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: text/plain;charset=utf-8

<-- HTTP/1.1 201 Created
<-- Location: https://cloud.example.com/cdmi/2.0.0/MyContainer/

Part III

CDMI Core
Clause 8

Data Object Resource Operations using CDMI

8.1 Overview

Data objects are the fundamental storage component within CDMI™ and are analogous to files within a file system. Each data object has a set of well-defined fields that include:

- a mandatory value,
- mandatory fields generated by the cloud storage system,
- mandatory metadata items generated by the cloud storage system,
- optional metadata generated by the cloud storage system; and
- optional metadata specified by the cloud user.

All cloud storage systems shall support data objects, but the ability to create a data object is determined by the presence or absence of the `cdmi_create_dataobject` and `cdmi_post_dataobject` capabilities in the parent container, and by the `cdmi_post_dataobject_by_ID` system-wide capability for creation by ID.

Each CDMI data object is represented as a JSON object, containing one or more “fields”. For example, the “metadata” field contains metadata items.

EXAMPLE 1: CDMI Data Object

```
{
  "objectType" : "application/cdmi-object",
  "objectID" : "00007ED90010D891022876A8DE0BC0FD",
  "objectName" : "MyDataObject.txt",
  "parentURI" : "/MyContainer/",
  "parentID" : "00007E7F00102E230ED82694DAA975D2",
  "domainURI" : "/cdmi_domains/MyDomain/",
  "capabilitiesURI" : "/cdmi_capabilities/dataobject/",
  "completionStatus" : "Complete",
  "mimetype" : "text/plain",
  "metadata" : {
    "cdmi_size" : "37"
  },
  "valuetransferencoding" : "utf-8",
  "valuerange" : "0-36",
  "value" : "This is the Value of this Data Object"
}
```

The meaning, use, and permitted values of each field is described in each operation that creates, modifies or retrieves CDMI data objects.
8.2 Data object details

8.2.1 Data object addressing

Data objects are addressed in CDMI in two ways:

- by name (e.g. https://cloud.example.com/cdmi/2.0.0/dataobject); and
- by ID (e.g. https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/
  00007ED90010D891022876A8DE0BC0FD).

Every data object has a single, globally-unique object identifier (ID) that remains constant for the life of the object. Each data object shall have one or more URI addresses that allow the object to be accessed.

8.2.2 Data object fields

Individual fields within a data object can be accessed by specifying the field name after a question mark “?” that is appended to the end of the data object URI.

EXAMPLE 2: The following URI returns the value field in the response body:

https://cloud.example.com/cdmi/2.0.0/dataobject?value

A list of unique fields, separated by an ampersand “&” can be specified, allowing multiple fields to be accessed in a single request.

EXAMPLE 3: The following URI returns the value and metadata fields in the response body:

https://cloud.example.com/cdmi/2.0.0/dataobject?value&metadata

When a client provides fields that are not defined in this International Standard or deserializes an object containing fields that are not defined in this International Standard, these fields shall be persisted, but shall not be interpreted.

8.2.3 Data Object Value

The encoding of the data transported in the data object value field depends on the data object valuetransferencoding field.

- If the value transfer encoding of the object is set to “utf-8”, the data stored in the value of the data object shall be a valid UTF-8 string and shall be transported as a UTF-8 string in the value field.
- If the value transfer encoding of the object is set to “base64”, the data stored in the value of the data object can contain arbitrary binary sequences, and it shall be transported as a base 64-encoded string in the value field.
- If the value transfer encoding of the object is set to “json”, the data stored in the value of the data object shall contain a valid JSON object, and the value field shall contain a valid JSON object. The JSON stored and returned shall be semantically equivalent but may not be syntactically identical. For example, whitespace outside of JSON-quoted strings may be removed or added by either client libraries or by the server. This means that the number of bytes sent may not be the same as the number of bytes stored.

Specific ranges of the value of a data object can be accessed by specifying a byte range after the value field name.

EXAMPLE 4: The following URI returns the first thousand bytes in the value field:

https://cloud.example.com/cdmi/2.0.0/dataobject?value=0-999

Because a byte range of a UTF-8 string is often not a valid UTF-8 string, the response to a range request shall always be transported in the value field as a base 64-encoded string. Likewise, when updating a range of bytes within the value of a data object, the contents of the value field shall be transported as a base 64-encoded string.

Byte ranges are specified as single inclusive byte ranges as per Section 14.35.1 of RFC 2616 [23].

The value of a data object can also be specified and retrieved using multipart MIME, where the CDMI JSON is transferred in the first MIME part, and the raw object value is transferred in the second MIME part. Each MIME part, including any header fields, shall conform to RFC 2045 [9], RFC 2046 [10], and RFC 2047 [22]. The length of each part can optionally be specified by a Content-Length header in addition to the MIME boundary delimiter.

Multiple non-overlapping ranges of the value of a data object can also be accessed or updated in a multipart MIME operation by transferring one MIME part for each range of the value. The byte ranges for these operations shall be specified as per Section 14.35.1 of RFC 2616 [23].

© SNIA 2020

SNIA Working Draft

58
Multipart MIME enables the efficient transfer of binary data alongside CDMI object metadata without incurring the overhead of the UTF-8 or Base64 encoding and validation required to represent binary data in JSON.

### 8.2.4 Data object metadata

Data object metadata can also include arbitrary user-supplied metadata, storage system metadata, and data system metadata, as specified in clause 16. Metadata shall be stored as a valid UTF-8 string. Binary data stored in user metadata shall be first encoded such that it can be contained in a UTF-8 string, with the use of base 64 encoding recommended.

Every data object has a parent object from which the data object inherits data system metadata that is not explicitly specified in the data object itself.

**EXAMPLE 5:** The “budget.xls” data object stored at the following URI would inherit data system metadata from its parent container, “finance”:

https://cloud.example.com/cdmi/2.0.0/finance/budget.xls

### 8.2.5 Data object access control

If read access to any of the requested fields is not permitted by the object ACL, only the permitted fields shall be returned.

If no requested fields are permitted to be read, an HTTP status code of **403 Forbidden** shall be returned to the client.

If write access to any of the requested fields is not permitted by the object ACL, no updates shall be performed, and an HTTP status code of **403 Forbidden** shall be returned to the client.

### 8.2.6 Data object consistency

Writing to a data object is an atomic operation.

- If a client reads a data object simultaneously with a write to that same data object, the reading client shall get either the old version or the new version, but not a mixture of both.
- If a write is terminated due to errors, the contents of the data object shall be as if the write never occurred (i.e., writes are atomic in the face of errors).

Create and update timestamps that are returned in response to multiple client writes to a given object can indicate that a specific write is the newest (i.e., the write whose data is expected to be returned to subsequent reads until another write is processed). However, there is no guarantee that the write with the latest timestamp is the one whose data is returned on subsequent reads.

Range writes can result in a gap in an object value that have had no data written to them. Reading from a gap in a data object value shall return zero for each byte read.

Implementations of this International Standard shall provide the atomicity features described in this subclause for data objects that are accessed via CDMI. The atomicity properties of data objects that are accessed by protocols other than CDMI are outside the scope of this International Standard.

### 8.2.7 Data object representations

The representations in this clause are shown using JSON notation. Both clients and servers shall support UTF-8 JSON representation. The request and response body JSON fields may be specified or returned in any order, with the exception that, if present, for data objects, the "valuerange" and "value" fields shall appear last and in that order.

### 8.2.8 Encrypted objects

CDMI data object operations only permit management operations and access to the ciphertext of encrypted objects.

For more details on encrypted objects, see clause 23.
8.3 Create a data object using CDMI

8.3.1 Synopsis

To create a new data object, the following request shall be performed:

- PUT <root URI>/<ContainerName>/<DataObjectName>

To create a new data object by ID, see 9.7.

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers that already exist, with one slash (i.e., “/”) between each pair of container names.
- <DataObjectName> is the name specified for the data object to be created.

After it is created, the data object shall also be accessible at <root URI>/cdmi_objectid/<objectID>.

8.3.2 Delayed completion of create

In response to a create operation for a data object, the server may return an HTTP status code of 202 Accepted to indicate that the object is in the process of being created. This response is useful for long-running operations (e.g., copying a large data object from a source URI). Such a response has the following implications.

- The server shall return a Location header with an absolute URI to the object to be created along with an HTTP status code of 202 Accepted.
- With an HTTP status code of 202 Accepted, the server implies that the following checks have passed:
  - user authorization for creating the object;
  - user authorization for read access to any source object for move, copy, serialize, or deserialize; and
  - availability of space to create the object or at least enough space to create a URI to report an error.
- A client might not be able to immediately access the created object, e.g., due to delays resulting from the implementation’s use of eventual consistency.

The client performs GET operations to the URI to track the progress of the operation. In response, the server returns two fields in its response body to indicate progress.

- A mandatory completionStatus text field contains either “Processing”, “Complete”, or an error string starting with the value “Error”.
- An optional percentComplete field contains the percentage of the operation that has completed (0 to 100).

GET shall not return any value for the data object when completionStatus is not “Complete”. If the final result of the create operation is an error, the URI is created with the completionStatus field set to the error message. It is the client’s responsibility to delete the URI after the error has been noted.
8.3.3 Capabilities

Capabilities that indicate which operations are supported are shown in Table 29.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_create_dataobject</td>
<td>Parent Container</td>
<td>Ability to create a new data object</td>
</tr>
<tr>
<td>cdmi_create_reference</td>
<td>Parent Container</td>
<td>Ability to create a new reference</td>
</tr>
<tr>
<td>cdmi_copy_dataobject</td>
<td>Parent Container</td>
<td>Ability to create a data object that is a copy of another data object</td>
</tr>
<tr>
<td>cdmi_move_dataobject</td>
<td>Parent Container</td>
<td>Ability to move a data object from another container</td>
</tr>
<tr>
<td>cdmi_deserialize_dataobject</td>
<td>Parent Container</td>
<td>Ability to create a data object that is deserialized from the contents of the PUT or the contents of another data object</td>
</tr>
<tr>
<td>cdmi_serialize_dataobject</td>
<td>Parent Container</td>
<td>Ability to create a data object that contains a serialized representation of an existing data object, container, domain or queue</td>

</tbody>
</table>

8.3.4 Request headers

The HTTP request headers for creating a CDMI data object using CDMI are shown in Table 30.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Header</td>
<td>&quot;application/cdmi-object&quot; or a consistent value defined in 5.5.2</td>
<td>Optional</td>
</tr>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>&quot;application/cdmi-object&quot; or &quot;multipart/mixed&quot;</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
|                       | string   | • If "multipart/mixed" is specified, the body shall consist of at least two MIME parts, where the first part shall contain a body of content-type "application/cdmi-object", and the second and subsequent parts shall contain one or more byte ranges of the value.  
|                       |          | • If multiple byte ranges are included and the Content-Range header is omitted for a part, the data in the part shall be appended to the data in the preceding part, with the first part having a byte offset of zero. |
| X-CDMI-Partial        | Header   | Indicates that the newly created object is part of a series of writes and has not yet been fully created. When set to "true", the completionStatus field shall be set to "Processing". X-CDMI-Partial works across CDMI and non-CDMI operations. | Optional      |
### 8.3.5 Request message body

The request message body fields for creating a data object using CDMI are shown in Table 31.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>mimetype</td>
<td>JSON string</td>
<td>MIME type of the data contained within the value field of the data object</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• This field may be included when creating by value or when deserializing, copying, and moving a data object.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is not included and multi-part MIME is not being used, the value of &quot;text/plain&quot; shall be assigned as the field value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is not included and multi-part MIME is being used, the value of the Content-Type header of the second MIME part shall be assigned as the field value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• This field field value shall be converted to lower case before being stored.</td>
<td></td>
</tr>
<tr>
<td>metadata</td>
<td>JSON object</td>
<td>Metadata for the data object</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is included, the contents of the JSON object provided in this field shall be used as data object metadata.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is included when deserializing, serializing, copying, or moving a data object, the contents of the JSON object provided in this field shall be used as object metadata instead of the metadata from the source URI.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is not included, no user-specified metadata shall be added to the object.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is not included when deserializing, serializing, copying, or moving a data object, metadata from the source URI shall be used.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• This field shall not be included when creating a reference to a data object.</td>
<td></td>
</tr>
<tr>
<td>domainURI</td>
<td>JSON string</td>
<td>URI of the owning domain</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If different from the parent domain, the user shall have the &quot;cross-domain&quot; privilege (see *cdmi member privileges in Table 80.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If not specified, the domain of the parent container shall be used.</td>
<td></td>
</tr>
<tr>
<td>deserialize</td>
<td>JSON string</td>
<td>URI of a CDMI data object with a value that contains a data object serialized as specified in clause 15. The serialized data object shall be deserialized to create the new data object.</td>
<td>Optional</td>
</tr>
<tr>
<td>serialize</td>
<td>JSON String</td>
<td>URI of a CDMI object that shall be serialized into the new data object</td>
<td>Optional</td>
</tr>
<tr>
<td>Field Name</td>
<td>Type</td>
<td>Description</td>
<td>Requirement</td>
</tr>
<tr>
<td>---------------</td>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>copy</td>
<td>JSON</td>
<td>URI of a source CDMI data object or queue object that shall be copied into the new destination data object.</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>string</td>
<td>• If the destination data object URI and the copy source object URI both do not specify individual fields, the destination data object shall be a complete copy of the source data object.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If the destination data object URI or the copy source object URI specifies individual fields, only the fields specified shall be used to create the destination data object. If specified fields are not present in the source, default field values shall be used.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If the destination data object URI and the copy source object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If the copy source object URI points to a queue object, as part of the copy operation, multiple queue values shall be concatenated into a single data object value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If the copy source object URI points to one or more queue object values, as part of the copy operation, the specified queue values shall be concatenated into a single data object value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If there are insufficient permissions to read the data object at the source URI or create the data object at the destination URI, or if the read operation fails, the copy shall return an HTTP status code of 400 Bad Request, and the destination object shall not be created.</td>
<td></td>
</tr>
<tr>
<td>move</td>
<td>JSON</td>
<td>URI of an existing local or remote CDMI data object (source URI) that shall be relocated to the URI specified in the PUT. The contents of the object, including the object ID, shall be preserved by a move, and the data object at the source URI shall be removed after the data object at the destination has been successfully created.</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>string</td>
<td>If there are insufficient permissions to read the data object at the source URI, write the data object at the destination URI, or delete the data object at the source URI, or if any of these operations fail, the move shall return an HTTP status code of 400 Bad Request, and the source and destination are left unchanged.</td>
<td></td>
</tr>
<tr>
<td>reference</td>
<td>JSON</td>
<td>URI of a CDMI data object that shall be redirected by a reference. If any other fields are supplied when creating a reference, the server shall respond with an HTTP status code of 400 Bad Request.</td>
<td>Optional</td>
</tr>
<tr>
<td>deserializewa</td>
<td>JSON</td>
<td>A data object serialized as specified in clause 15 and encoded using base 64 encoding rules described in RFC 4648 [19], that shall be deserialized to create the new data object.</td>
<td>Optional</td>
</tr>
<tr>
<td>value</td>
<td>string</td>
<td>• If multi-part MIME is being used and this field contains the value of the MIME boundary parameter, the contents of the second MIME part shall be assigned as the field value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If the serialized data object in the second MIME part does not include a value field, the contents of the third MIME part shall be assigned as the field value of the value field.</td>
<td></td>
</tr>
<tr>
<td>Field Name</td>
<td>Type</td>
<td>Description</td>
<td>Requirement</td>
</tr>
<tr>
<td>-------------------------</td>
<td>------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------</td>
</tr>
</tbody>
</table>
| valuetransfer encoding  | JSON string| The value transfer encoding used for the data object value. Three value transfer encodings are defined.  
• “utf-8” indicates that the data object contains a valid UTF-8 string, and it shall be transported as a UTF-8 string in the value field.  
• “base64” indicates that the data object may contain arbitrary binary sequences, and it shall be transported as a base 64-encoded string in the value field. Setting the contents of the data object value field to any value other than a valid base 64 string shall result in an HTTP status code of 400 Bad Request being returned to the client.  
• “json” indicates that the data object contains a valid JSON object, and the value field shall be a JSON object containing valid JSON data. If the contents of the value field are set to any value other than a valid JSON object, an HTTP status code of 400 Bad Request shall be returned to the client.  
• This field shall only be included when creating a data object by value.  
• If this field is not included and multi-part MIME is not being used, the value of “utf-8” shall be assigned as the field value.  
• If this field is not included and multi-part MIME is being used, the value of “utf-8” shall be assigned as the field value if the Content-Type header of the second and all MIME parts includes the charset parameter as defined in RFC 2046 of “utf-8” (e.g., “;charset=utf-8”). Otherwise, the value of “base64” shall be assigned as the field value. This field applies only to the encoding of the value when represented in CDMI; the Content-Transfer-Encoding header of the part specifies the encoding of the value within a multi-part MIME request, as defined in RFC 2045 [9]. | Optional¹     |
| value                   | JSON string| The data object value  
• If this field is not included and multi-part MIME is not being used, an empty JSON String (i.e., “”) shall be assigned as the field value.  
• If this field is not included and multi-part MIME is being used, the contents of the second MIME part shall be assigned as the field value.  
• If the valuetransferencoding field indicates UTF-8 encoding, the value shall be a UTF-8 string escaped using the JSON escaping rules described in RFC 4627 [5].  
• If the valuetransferencoding field indicates base 64 encoding, the value shall be first encoded using the base 64 encoding rules described in RFC 4648 [19].  
• If the valuetransferencoding field indicates JSON encoding, the value shall contain a valid JSON object. | Optional¹     |

¹ Only one of these fields shall be specified in any given operation. Except for value, these fields shall not be stored. If more than one of these fields is supplied, the server shall respond with an HTTP status code of 400 Bad Request.
8.3.6 Response headers

The HTTP response headers for creating a data object using CDMI are shown in Table 32.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>&quot;application/cdmi-object&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Location</td>
<td>Header</td>
<td>When an HTTP status code of 202 Accepted is returned, the server shall respond with the absolute URL of the object that is in the process of being created.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

8.3.7 Response message body

The response message body fields for creating a data object using CDMI are shown in Table 33.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>JSON</td>
<td>&quot;application/cdmi-object&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectID</td>
<td>JSON</td>
<td>Object ID of the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectName</td>
<td>JSON</td>
<td>Name of the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parentURI</td>
<td>JSON</td>
<td>URI for the parent object.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parentID</td>
<td>JSON</td>
<td>Object ID of the parent container object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>domainURI</td>
<td>JSON</td>
<td>URI of the owning domain</td>
<td>Mandatory</td>
</tr>
<tr>
<td>capabilitiesURI</td>
<td>JSON</td>
<td>URI to the capabilities for the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>completionStatus</td>
<td>JSON</td>
<td>A string indicating if the object is still in the process of being created or updated by another operation, and after that operation is complete, indicates if it was successfully created or updated or if an error occurred. The value shall be the string &quot;Processing&quot;, the string &quot;Complete&quot;, or an error string starting with the value &quot;Error&quot;.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
| percentComplete| JSON | A string indicating the percentage of completion if the object is still in the process of being created or updated by another operation.  
• When the value of completionStatus is "Processing", this field, if provided, shall indicate the percentage of completion as a numeric integer value from "0" through "100".  
• When the value of completionStatus is "Complete", this field, if provided, shall contain the value "100".  
• When the value of completionStatus is "Error", this field, if provided, may contain any integer value from "0" through "100". | Optional     |
| mimetype       | JSON  | MIME type of the value of the data object                                   | Mandatory   |

<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata</td>
<td>JSON object</td>
<td>Metadata for the data object. This field includes any user and data system metadata specified in the request body metadata field, along with storage system metadata generated by the cloud storage system. See clause 16 for a further description of metadata.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

#### 8.3.8 Response status

The HTTP status codes that occur when creating a data object using CDMI are described in Table 34.

**Table 34: HTTP status codes - Create a data object using CDMI**

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201 Created</td>
<td>The new data object was created.</td>
</tr>
<tr>
<td>202 Accepted</td>
<td>The data object is in the process of being created. The CDMI client should monitor the completionStatus and percentComplete fields to determine the current status of the operation.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

#### 8.3.9 Examples

**EXAMPLE 1: PUT to the container URI the data object name and contents:**

```
--> PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object
--> Content-Type: application/cdmi-object
--> { "mimetype" : "text/plain", "metadata" : {} },
--> "value" : "This is the Value of this Data Object"
<--
H/1.1 201 Created
Content-Type: application/cdmi-object
<--
```
EXAMPLE 2: PUT to the container URI the data object name and binary contents:

```
---> PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
---> Host: cloud.example.com
---> Accept: application/cdmi-object
---> Content-Type: application/cdmi-object
--->
--->{  
  --> "mimetype": "text/plain",
  --> "metadata": {}
  --> "valuetransferencoding": "base64"
  --> "value": "VGhpcyBpcyB0aGUgVmFsdWVub2YgdGhpcyBEYXRhIE9iamVjdA=="
-->
}  
<-- HTTP/1.1 201 Created
<-- Content-Type: application/cdmi-object
<--
<-- {  
  <-- "objectType": "application/cdmi-object",
  <-- "objectID": "00007ED9001008C174ABCE6AC3287E5F",
  <-- "objectName": "MyDataObject.txt",
  <-- "parentURI": "/MyContainer/",
  <-- "parentID": "00007E7F00102E230ED82694DA975D2",
  <-- "domainURI": "/cdmi_domains/MyDomain/",
  <-- "capabilitiesURI": "/cdmi_capabilities/dataobject/",
  <-- "completionStatus": "Complete",
  <-- "mimetype": "text/plain",

    "cdmi_size": "37"
  }
<-- }
```

EXAMPLE 3: PUT to the container URI the data object name and binary contents using multi-part MIME:

```
---> PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
---> Host: cloud.example.com
---> Accept: application/cdmi-object
---> Content-Type: multipart/mixed; boundary=gc0p4Jq0M2Yt08j34c0p
-->
-->--gc0p4Jq0M2Yt08j34c0p
---> Content-Type: application/cdmi-object
--->
--->{  
  --> "domainURI": "/cdmi_domains/MyDomain/",
  --> "metadata": {
    --> "colour": "blue"
  }
-->
}  
-->
-->--gc0p4Jq0M2Yt08j34c0p
---> Content-Type: application/octet-stream
---> Content-Transfer-Encoding: binary
-->
--> 37 bytes of binary data
-->
-->--gc0p4Jq0M2Yt08j34c0p--
<-- HTTP/1.1 201 Created
<-- Content-Type: application/cdmi-object
<--
<-- {  
  <-- "objectType": "application/cdmi-object",
  <-- "objectID": "00007ED900103ADE9DE3A8D1CF5436A3",
  <-- "objectName": "MyDataObject.txt",
  <-- "parentURI": "/MyContainer/",
  <-- "parentID": "00007E7F0010102E230ED82694DA975D2",
  <-- "domainURI": "/cdmi_domains/MyDomain/",
  <-- "capabilitiesURI": "/cdmi_capabilities/dataobject/",
  <-- "completionStatus": "Complete",
  <-- "mimetype": "application/octet-stream",
```
EXAMPLE 4: PUT to the container URI the data object name and binary contents using multi-part MIME with optional content-lengths for the parts:

```plaintext
-- PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
-- Host: cloud.example.com
-- Accept: application/cdmi-object
-- Content-Type: multipart/mixed; boundary=gc0p4Jq0M2Yt08j34c0
--
-- gc0p4Jq0M2Yt08j34c0
-- Content-Type: application/cdmi-object
-- Content-Length: 82
--
-- {
--   "domainURI": "/cdmi_domains/MyDomain/",
--   "metadata": { }
-- }
-- gc0p4Jq0M2Yt08j34c0
-- Content-Type: application/octet-stream
-- Content-Transfer-Encoding: binary
-- Content-Length: 37
--<37 bytes of binary data>
-- gc0p4Jq0M2Yt08j34c0--

HTTP/1.1 201 Created

```

EXAMPLE 5: PUT to the container URI the data object name and JSON contents:

```plaintext
-- PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
-- Host: cloud.example.com
-- Accept: application/cdmi-object
-- Content-Type: application/cdmi-object
--
-- {
--   "mimetype" : "text/plain",
--   "metadata" : { },
--   "valuetransferencoding" : "json"
-- }
```

(continues on next page)
Cloud Data Management Interface 2.0.0a

1579 EXAMPLE 6: PUT to the container URI to create an encrypted object:

```plaintext
--> PUT /cdmi/2.0.0/MyContainer/MyEncryptedObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> }
--> "mimetype" : "application/cms",
--> "metadata" : {
--> "cdmi_enc_key_id" : "testkey"
--> },
--> "valuetransferencoding" : "base64"
--> "value" : "<CMS Encrypted Object in Base64>"
--> }
</-
HTTP/1.1 201 Created
```
EXAMPLE 7: PUT to the container URI to create an encrypted object:

```plaintext
--> PUT /cdmi/2.0.0/MyContainer/MyEncryptedObject2.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> "mimetype": "application/jose+json",
--> "metadata": {
--> "cdmi_enc_key_id": "77c7e2b8-6e13-45cf-8672-617b5b45243a"
--> },
--> "valueencoding": "json",

8.4 Read a data object using CDMI

8.4.1 Synopsis

To read an existing data object, the following requests shall be performed:

- GET <root URI>/<ContainerName>/<DataObjectName>
- GET <root URI>/<ContainerName>/<DataObjectName>?<fieldname>&<fieldname>&...
- GET <root URI>/<ContainerName>/<DataObjectName>?value=<range>&...
- GET <root URI>/cdmi_objectid/<DataObjectID>
- GET <root URI>/cdmi_objectid/<DataObjectID>?<fieldname>&<fieldname>&...
- GET <root URI>/cdmi_objectid/<DataObjectID>?value=<range>&...
- GET <root URI>/cdmi_objectid/<DataObjectID>?metadata=<prefix>&...

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers.
- <DataObjectName> is the name of the data object to be read from.
- <fieldname> is the name of a field.
- <range> is a byte range of the data object value to be returned in the value field.
- <prefix> is a matching prefix that returns all metadata items that start with the prefix value.
- <DataObjectID> is the ID of the data object to be read from.

8.4.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 35.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_read_metadata</td>
<td>Data Object</td>
<td>Ability to read the metadata of an existing data object</td>
</tr>
<tr>
<td>cdmi_read_value</td>
<td>Data Object</td>
<td>Ability to read the value of an existing data object</td>
</tr>
<tr>
<td>cdmi_read_value_range</td>
<td>Data Object</td>
<td>Ability to read a sub-range of the value of an existing data object</td>
</tr>
<tr>
<td>cdmi_multipart_mime</td>
<td>System Wide Capability</td>
<td>Ability to read a data object using multi-part MIME</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System Wide Capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

8.4.3 Request headers

The HTTP request headers for reading a CDMI data object using CDMI are shown in Table 36.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Header string</td>
<td>&quot;application/cdmi-object&quot;,&quot;multipart/mixed&quot;,or a consistent value defined in 5.5.2</td>
<td>Optional</td>
</tr>
</tbody>
</table>
8.4.4 Request message body

A request body shall not be provided.

8.4.5 Response headers

The HTTP response headers for reading a data object using CDMI are shown in Table 37.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>&quot;application/cdmi-object&quot; or &quot;multipart/mixed&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>string</td>
<td>• If &quot;multipart/mixed&quot;, the body shall consist of at least two MIME parts,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>where the first part shall contain a body of content-type &quot;application/cdmi-object&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>and the second and subsequent parts shall contain the requested byte ranges</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>of the value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If multiple byte ranges are included and the Content-Range header is</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>omitted for a part, the data in the part shall be appended to the data in</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the preceding part, with the first part having a byte offset of zero.</td>
<td></td>
</tr>
<tr>
<td>Location</td>
<td>Header</td>
<td>The server shall respond with the URI that the reference redirects to if</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>string</td>
<td>the object is a reference.</td>
<td></td>
</tr>
</tbody>
</table>

8.4.6 Response message body

The response message body fields for reading a CDMI data object using CDMI are shown in Table 38.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>JSON</td>
<td>&quot;application/cdmi-object&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectID</td>
<td>JSON</td>
<td>Object ID of the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectName</td>
<td>JSON</td>
<td>Name of the object</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For objects in a container, the objectName field shall be returned.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For objects not in a container (objects that are only accessible by ID),</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the &quot;objectName&quot; field does not exist and shall not be returned.</td>
<td></td>
</tr>
<tr>
<td>parentURI</td>
<td>JSON</td>
<td>URI for the parent object</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>string</td>
<td>• For objects in a container, the parentURI field shall be returned.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For objects not in a container (objects that are only accessible by ID),</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the &quot;parentURI&quot; field does not exist and shall not be returned.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Appending the &quot;objectName&quot; to the &quot;parentURI&quot; shall always produce a valid</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>URI for the object.</td>
<td></td>
</tr>
</tbody>
</table>

Continued on next page
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| parentID         | JSON string | Object ID of the parent container object  
- For objects in a container, the "parentID" field shall be returned.  
- For objects not in a container (objects that are only accessible by ID), the "parentID" field does not exist and shall not be returned. | Conditional  |
| domainURI        | JSON string | URI of the owning domain                                                                                                                                                                                   | Mandatory    |
| capabilitiesURI  | JSON string | URI to the capabilities for the object                                                                                                                                                                   | Mandatory    |
| completionStatus | JSON string | A string indicating if the object is still in the process of being created or updated by another operation, and after that operation is complete, indicates if it was successfully created or updated or if an error occurred.  
The value shall be the string "Processing", the string "Complete", or an error string starting with the value "Error". | Mandatory    |
| percentComplete  | JSON string | A string indicating the percentage of completion if the object is still in the process of being created or updated by another operation.  
- When the value of completionStatus is "Processing", this field, if provided, shall indicate the percentage of completion as a numeric integer value from 0 through 100.  
- When the value of completionStatus is "Complete", this field, if provided, shall contain the value "100".  
- When the value of completionStatus is "Error", this field, if provided, may contain any integer value from "0" through "100". | Optional     |
| mimetype         | JSON string | MIME type of the value of the data object                                                                                                                                                               | Mandatory    |
| metadata         | JSON object | Metadata for the data object. This field includes any user and data system metadata specified in the request body metadata field, along with storage system metadata generated by the cloud storage system.  
See clause 16 for a further description of metadata. | Mandatory    |
| valuerange       | JSON string | The range of bytes of the data object to be returned in the value field  
- If a specific value range has been requested, the valuerange field shall correspond to the bytes requested. If the request extends beyond the end of the value, the valuerange field shall indicate the smaller byte range returned.  
- If the object value has gaps (due to PUTs with non-contiguous value ranges), the value range will indicate the range to the first gap in the object value.  
- The cdmi_size storage system metadata of the data object shall always indicate the complete size of the object, including zero-filled gaps. | Mandatory    |
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>valuetransfer encoding</td>
<td>string</td>
<td>The value transfer encoding used for the data object value. Three value transfer encodings are defined: • &quot;utf-8&quot; indicates that the data object contains a valid UTF-8 string, and it shall be transported as a UTF-8 string in the value field. • &quot;base64&quot; indicates that the data object may contain arbitrary binary sequences, and it shall be transported as a base 64-encoded string in the value field. • &quot;json&quot; indicates that the data object contains a valid JSON object, and the value field shall contain a valid JSON object.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>value</td>
<td>string</td>
<td>The data object value • If the valuetransferencoding field indicates UTF-8 encoding, the value field shall contain a UTF-8 string using JSON escaping rules described in RFC 4627 [5]. • If the valuetransferencoding field indicates base 64 encoding, the value field shall contain a base 64-encoded string as described in RFC 4648 [19]. • If the valuetransferencoding field indicates JSON encoding, the value field shall contain a valid JSON object. • The value field shall not be provided when using multi-part MIME. • The value field shall only be provided when the completionStatus field contains &quot;Complete&quot;. • When reading a value, zeros shall be returned for any gaps resulting from non-contiguous writes.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

If individual fields are specified in the GET request, only these fields are returned in the result body. Optional fields that are requested but do not exist are omitted from the result body.

### 8.4.7 Response status

The HTTP status codes that occur when reading a data object using CDMI are described in Table 39.

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 OK</td>
<td>The data object content was returned in the response.</td>
</tr>
<tr>
<td>202 Accepted</td>
<td>The data object is in the process of being created. The CDMI client should monitor the completionStatus and percentComplete fields to determine the current status of the operation.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>406 Not Acceptable</td>
<td>The server is unable to provide the object in the specified in the Accept header.</td>
</tr>
</tbody>
</table>
8.4.8 Examples

EXAMPLE 1: GET to the data object URI to read all fields of the data object:

```plaintext
---> GET /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object
<< HTTP/1.1 200 OK
<< Content-Type: application/cdmi-object
<<
<<
<< "objectType": "application/cdmi-object",
<< "objectID": "00007ED90010D891022876A8DE0BC0FD",
<< "objectName": "MyDataObject.txt",
<< "parentURI": "/MyContainer/",
<< "parentID": "00007E7F00102E230ED82694DA975D2",
<< "domainURI": "/cdmi_domains/MyDomain/",
<< "capabilitiesURI": "/cdmi_capabilities/dataobject/",
<< "completionStatus": "Complete",
<< "mimetype": "text/plain",
<< "metadata": {
<< "cdmi_size": "37"
<< },
<< "valuerange": "0-36",
<< "valuetransferencoding": "utf-8",
<< "value": "This is the Value of this Data Object"
<<
```

EXAMPLE 2: GET to the data object URI by ID to read all fields of the data object:

```plaintext
---> GET /cdmi/2.0.0/cdmi_objectid/00007ED90010D891022876A8DE0BC0FD HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object
<< HTTP/1.1 200 OK
<< Content-Type: application/cdmi-object
<<
<<
<< "objectType": "application/cdmi-object",
<< "objectID": "00007ED90010D891022876A8DE0BC0FD",
<< "objectName": "MyDataObject.txt",
<< "parentURI": "/MyContainer/",
<< "parentID": "00007E7F00102E230ED82694DA975D2",
<< "domainURI": "/cdmi_domains/MyDomain/",
<< "capabilitiesURI": "/cdmi_capabilities/dataobject/",
<< "completionStatus": "Complete",
<< "mimetype": "text/plain",
<< "metadata": {
<< "cdmi_size": "37"
<< },
<< "valuerange": "0-36",
<< "valuetransferencoding": "utf-8",
<< "value": "This is the Value of this Data Object"
<<
```

EXAMPLE 3: GET to the data object URI to read the value and mimetype fields of the data object:

```plaintext
---> GET /cdmi/2.0.0/MyContainer/MyDataObject.txt?value&mimetype HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object
<< HTTP/1.1 200 OK
<< Content-Type: application/cdmi-object
<<
<<
<< "value": "This is the Value of this Data Object",
<< "mimetype": "text/plain"
<<
```
EXAMPLE 4: GET to the data object URI to read the first 11 bytes of the value of the data object:

```plaintext
GET /cdmi/2.0.0/MyContainer/MyDataObject.txt?valuerange&value=0-10 HTTP/1.1
Host: cloud.example.com
Accept: application/cdmi-object

HTTP/1.1 200 OK
Content-Type: application/cdmi-object

```

```
{
"valuerange": "0-10",
"value": "VGhpcyBpcyB0aGU="
}
```

EXAMPLE 5: GET to the data object URI to read the data object using multi-part MIME:

```plaintext
GET /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
Host: cloud.example.com
Accept: multipart/mixed

HTTP/1.1 200 OK
Content-Type: multipart/mixed; boundary=gc0p4Jq0M2Yt08j34c0p

```

```
Content-Type: application/cdmi-object

```

```
{ 
"objectType": "application/cdmi-object",
"objectID": "00007ED90010C2414303B5C6D4F83170",
"parentURI": "/MyContainer/",
"parentID": "00007ED90010C2414303B5C6D4F83170",
"domainURI": "/cdmi_domains/MyDomain/",
"capabilitiesURI": "/cdmi_capabilities/dataobject/",
"completionStatus": "Complete",
"mimetype": "application/octet-stream",
"metadata": {
"cdmi_size": "37",
"colour": "blue",
... 
"valuerange": "0-36",
"valuetransferencoding": "base64"
},

```

```
--gc0p4Jq0M2Yt08j34c0p
Content-Type: application/octet-stream
Content-Transfer-Encoding: binary
<37 bytes of binary data>
--gc0p4Jq0M2Yt08j34c0p--
```

EXAMPLE 6: GET to the data object URI to read the data object using multi-part MIME, with optional content-lengths for the parts:

```plaintext
GET /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
Host: cloud.example.com
Accept: multipart/mixed

HTTP/1.1 200 OK
Content-Type: multipart/mixed; boundary=gc0p4Jq0M2Yt08j34c0p

```

```
Content-Type: application/cdmi-object
Content-Length: 505

```

```
{ 
"objectType": "application/cdmi-object",
"objectID": "00007ED90010C2414303B5C6D4F83170",

```

(continues on next page)
EXAMPLE 7: GET to the data object URI to read the metadata and multiple byte ranges of the binary contents using multi-part MIME:

```plaintext
-- HTTP/1.1 200 OK
-- Content-Type: multipart/mixed; boundary=gc0p4Jq0M2Yt08j34c0p
-- gc0p4Jq0M2Yt08j34c0p
-- Content-Type: application/cdmi-object
-- "metadata": {
-- "cdmi_size": "37",
-- "colour": "blue",
-- ...
-- }
-- gc0p4Jq0M2Yt08j34c0p
-- Content-Type: application/octet-stream
-- Content-Transfer-Encoding: binary
-- Content-Range: bytes 0-10/37
-- <11 bytes of binary data>
-- gc0p4Jq0M2Yt08j34c0p
-- Content-Type: application/octet-stream
-- Content-Transfer-Encoding: binary
-- Content-Range: bytes 21-24/37
-- <4 bytes of binary data>
-- gc0p4Jq0M2Yt08j34c0p--
```
EXAMPLE 8: GET to the data object URI to read the value and valuetransferencoding fields of a data object storing JSON data:

```
--> GET /cdmi/2.0.0/cdmi_objectid/0000706D0010374085EF1A5C7018D774? valuetransferencoding&value HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object

<-- Content-Type: application/cdmi-object
<--
<-- {
<--   "valuetransferencoding": "json",
<--   "value": {
<--     "test": "value"
<--   }
<-- }
```

EXAMPLE 9: GET to the data object URI to read a newly-created data object with a current version:

```
--> GET /cdmi/2.0.0/MyContainer/MyVersionedDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object

<-- Content-Type: application/cdmi-object
<--
<-- {
<--   "objectType": "application/cdmi-object",
<--   "objectID": "00007ED900100DA32EC94351F8970400",
<--   "objectName": "MyVersionedDataObject.txt",
<--   "parentURI": "/MyContainer/",
<--   "parentID": "00007E7F00102E230ED82694DA975D2",
<--   "domainURI": "/cdmi_domains/MyDomain/",
<--   "capabilitiesURI": "/cdmi_capabilities/dataobject/",
<--   "completionStatus": "Complete",
<--   "mimetype": "text/plain",
<--   "metadata": {
<--     "cdmi_size": "33",
<--     "cdmi_versioning": "user",
<--     "cdmi_version_object": "/cdmi_objectid/00007ED900100DA32EC94351F8970400",
<--     "cdmi_version_current": "/cdmi_objectid/00007ED90010512EB55A9304EAC5D4AA",
<--     "cdmi_version_oldest": ["/cdmi_objectid/00007ED90010512EB55A9304EAC5D4AA"],
<--     ...
<--   },
<--   "valuerange": "0-32",
<--   "valuetransferencoding": "utf-8",
<--   "value": "First version of this Data Object"
<-- }
```

EXAMPLE 10: GET to the data object URI to read a data object with two historical versions:

```
--> GET /cdmi/2.0.0/MyContainer/MyVersionedDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object

<-- Content-Type: application/cdmi-object
<--
<-- {
<--   "objectType": "application/cdmi-object",
<--   "objectID": "00007ED900100DA32EC94351F8970400",
<--   "objectName": "MyDataObject.txt",
<--   "parentURI": "/MyContainer/",
<--   "parentID": "00007E7F00102E230ED82694DA975D2",
<--   "domainURI": "/cdmi_domains/MyDomain/",
<--   "capabilitiesURI": "/cdmi_capabilities/dataobject/",
<--   "completionStatus": "Complete",
<--   "mimetype": "text/plain",
```
EXAMPLE 11: GET to the URI of a data object version:

```http
GET /cdmi/2.0.0/cdmi_objectid/00007ED900100519289E9EBE599D94BB HTTP/1.1
Host: cloud.example.com
Accept: application/cdmi-object

Content-Type: application/cdmi-object

"objectType": "application/cdmi-object",
"objectID": "00007ED900100519289E9EBE599D94BB",
"objectName": "MyVersionedDataObject.txt",
"parentURI": "/MyContainer]/",
"parentID": "00007EF00102E320E082694DAA9753D2",
"domainURI": "/cdmi_domains/MyDomain/",
"capabilitiesURI": "/cdmi_capabilities/dataobject/dataobject_version/",
"completionStatus": "Complete",
"mimetype": "text/plain",
"metadata": {
  "cdmi_size": "34",
  "cdmi_version_object": "/cdmi_objectid/00007ED900100519289E9EBE599D94BB",
  "cdmi_version_current": "/cdmi_objectid/00007ED90010F077F4EB1C99C87524CC",
  "cdmi_version_oldest": "/cdmi_objectid/00007ED90010512EB55A9304EAC5D4AA",
  "cdmi_version_parent": "/cdmi_objectid/00007ED90010512EB55A9304EAC5D4AA",
  "cdmi_version_children": ["/cdmi_objectid/00007ED90010F077F4EB1C99C87524CC",
  "..."
  ],
  "valuerange": "0-33",
  "valuetransferencoding": "utf-8",
  "value": "Second version of this Data Object"
}
```
8.5 Update a data object using CDMI

8.5.1 Synopsis

To update part or all of an existing data object, the following requests shall be performed:

- `PATCH <root URI>/<ContainerName>/<DataObjectName>`
- `PATCH <root URI>/<ContainerName>/<DataObjectName>?value=<range>`
- `PATCH <root URI>/<ContainerName>/<DataObjectName>?metadata=<metadataname>&...`
- `PATCH <root URI>/cdmi_objectid/<DataObjectID>`
- `PATCH <root URI>/cdmi_objectid/<DataObjectID>?value=<range>`
- `PATCH <root URI>/cdmi_objectid/<DataObjectID>?metadata=<metadataname>&...`

Where:

- `<root URI>` is the path to the CDMI cloud.
- `<ContainerName>` is zero or more intermediate containers.
- `<DataObjectName>` is the name of the data object to be updated.
- `<range>` is a byte range for the data object value to be updated.
- `<DataObjectID>` is the ID of the data object to be updated.

8.5.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 40.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_modify_metadata</td>
<td>Data Object</td>
<td>Ability to modify the metadata of an existing data object</td>
</tr>
<tr>
<td>cdmi_modify_value</td>
<td>Data Object</td>
<td>Ability to modify the value of an existing data object</td>
</tr>
<tr>
<td>cdmi_modify_value_range</td>
<td>Data Object</td>
<td>Ability to modify a sub-range of the value of an existing data object</td>
</tr>
<tr>
<td>cdmi.multipart_mime</td>
<td>System Wide</td>
<td>Capability Ability to modify a data object using multi-part MIME</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System Wide</td>
<td>Capability Ability to access the object by ID</td>
</tr>
</tbody>
</table>
8.5.3 Request headers

The HTTP request headers for updating a CDMI data object using CDMI are shown in Table 41.

Table 41: Request headers - Update a CDMI data object using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| Content-Type       | Header   | "application/cdmi-object" or "multipart/mixed"  
• If "multipart/mixed" is specified, the body shall consist of at least two MIME parts, where the first part shall contain a body of content-type "application/cdmi-object", and the second and subsequent parts shall contain one or more byte ranges of the value.  
• If multiple byte ranges are included and the Content-Range header is omitted for a part, the data in the part shall be appended to the data in the preceding part, with the first part having a byte offset of zero. | Mandatory   |
| X-CDMI-Partial     | Header   | Indicates that the newly created object is part of a series of writes and has not yet been fully created. When set to "true", the completionStatus field shall be set to "Processing". X-CDMI-Partial works across CDMI and non-CDMI operations. If the completionStatus field had previously been set to "Processing" by including this header in a create or update, the next update without this field shall change the completionStatus field back to "Complete". | Optional    |

8.5.4 Request message body

The request message body fields for updating a data object using CDMI are shown in Table 42.
Table 42: Request message body - Update a CDMI data object using CDMI

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| mimetype      | JSON string | MIME type of the data contained within the value field of the data object. If present, this value replaces the existing mimetype field value.  
  • This field may be included when updating by value, deserializing, and copying a data object.  
  • If this field is not included, the existing value of the mimetype field shall be left unchanged.  
  • This field field value shall be converted to lower case before being stored.  
  If this field is set to "application/cms" or "application/jose+json", the CDMI server shall encrypt or reencrypt the value of the object in place, using the key specified by the "cdmi_enc_key_id" metadata item. If the "cdmi_enc_key_id" metadata item is not present, the object ID shall be used as the key identifier. The mimetype of the plaintext shall be stored in the CMS or JWE JSON representation.  
  If a "cdmi_enc_value_sign_id" metadata item is present, the encrypted object shall also be signed.  
  If this field is changed from "application/cms" or "application/jose+json" to any other mimetype, the CDMI server shall decrypt the value of the object in place, replacing the specified mimetype with the mimetype of the encrypted object, if stored as part of the encrypted object.  
  For more details on encrypted objects, see clause 23. | Optional |
| metadata      | JSON object | Metadata for the data object. If present, the new metadata specified replaces the existing object metadata. If individual metadata items are specified in the URI, only those items are replaced; other items are preserved. See clause 16 for a further description of metadata. | Optional |
| domainURI     | JSON string | URI of the owning domain  
  • If different from the parent domain, the user shall have the "cross-domain" privilege (see cdmi_member_privileges in Table 80).  
  • If not specified, the existing domain shall be preserved. | Optional |
| deserialize    | JSON string | URI of a CDMI data object with a value that contains a data object serialized as specified in clause 15. The serialized data object shall be deserialized to update the existing data object.  
  The object ID of the serialized data object shall match the object ID of the destination data object. Otherwise, the server shall return an HTTP status code of 400 Bad Request. | Optional |
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| copy            | JSON string | URI of a source CDMI data object or queue object that shall be copied into an existing destination data object.  
• If the destination data object URI and the copy source object URI both do not specify individual fields, the destination data object shall be replaced with the source data object.  
• If the destination data object URI or the copy source object URI specifies individual fields, only the fields specified shall be used to update the destination data object. If specified fields are not present in the source, these fields shall be ignored.  
• If the destination data object URI and the copy source object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client.  
If the copy source object URI points to a queue object, as part of the copy operation, multiple queue values shall be concatenated into a single data object value.  
If there are insufficient permissions to read the data object at the source URI, update the data object at the destination URI, or if the read operation fails, the copy shall return an HTTP status code of 400 Bad Request, and the destination shall be left unchanged. | Optional¹ |
| deserializevalue | JSON string | A data object serialized as specified in clause 15 and encoded using base 64 encoding rules described in RFC 4648 [19], that shall be deserialized to update the existing data object.  
The object ID of the serialized data object shall match the object ID of the destination data object. Otherwise, the server shall return an HTTP status code of 400 Bad Request. | Optional¹ |

<td>JSON string</td>
<td>The value transfer encoding used for the data object value. Three value transfer encodings are defined:</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;utf-8&quot; indicates that the data object contains a valid UTF-8 string and shall be transported as a UTF-8 string in the value field. If the contents of the data object value field are set or updated to any value other than a valid UTF-8 string, an HTTP status code of 400 Bad Request shall be returned to the client.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;base64&quot; indicates that the data object may contain arbitrary binary sequence and shall be transported as a base 64 encoded string in the value field. Setting the contents of the data object value field to any value other than a valid base 64 string shall result in an HTTP status code of 400 Bad Request being returned to the client.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;json&quot; indicates that the data object contains a valid JSON object and shall be transported as a JSON object in the value field. If the contents of the data object value field are set or updated to any value other than a valid JSON object, an HTTP status code of 400 Bad Request shall be returned to the client.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>This field shall only be included when updating a data object by value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is not included and multi-part MIME is not being used, the existing value of &quot;valuetransferencoding&quot; shall be left unchanged.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is not included and multi-part MIME is being used, the value of &quot;utf-8&quot; shall be assigned as the field value if the &quot;Content-Type&quot; header of the second and all subsequent MIME parts includes the charset parameter as defined in RFC 2046 of &quot;utf-8&quot; (e.g., &quot;;charset=utf-8&quot;). Otherwise, the value of &quot;base64&quot; shall be assigned as the field value. This field applies only to the encoding of the value when represented in JSON; the &quot;Content-Transfer-Encoding&quot; header of the part specifies the encoding of the value within a multi-part MIME request, as defined in RFC 2045.</td>
<td></td>
</tr>
</tbody>
</table>

</tr>
</thead>
</table>
| value      | JSON string | This field contains the new data for the object. If present, this value replaces the existing value.  
• If this field is not included and multi-part MIME is being used, the contents of the second and subsequent MIME parts shall be assigned to the corresponding byte ranges of the field value.  
• If the valuetransferencoding field indicates UTF-8 encoding, the value shall be a UTF-8 string escaped using the JSON escaping rules described in RFC 4627 [5].  
• If the valuetransferencoding field indicates base 64 encoding, the value shall be first encoded using the base 64 encoding rules described in RFC 4648 [19].  
• If the valuetransferencoding field indicates JSON encoding, the value field shall contain a valid JSON object.  
• If a value range was specified in the request, the new data shall be inserted at the location specified by the range. Any resulting gaps between ranges shall be treated as if zeros had been written and shall be included when calculating the size of the value. When storing a range, the value shall be encoded using base 64, and the valuetransferencoding field shall be set to "base64". | Optional¹   |

8.5.5 Response header

The HTTP response header for updating a data object using CDMI is shown in Table 43.

Table 43: Response header - Update a CDMI data object using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>

<td>Header string</td>
<td>The server shall respond with the URI to which the reference redirects if the object is a reference.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

8.5.6 Response message body

A response body can be provided as per RFC 2616 [23].

8.5.7 Response status

The HTTP status codes that occur when updating a data object using CDMI are described in Table 44.

¹ Only one of these fields shall be specified in any given operation. Except for value, these fields shall not be stored. If more than one of these fields is supplied, the server shall respond with an HTTP status code of 400 Bad Request.
Table 44: HTTP status codes - Update a CDMI data object using CDMI

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

8.5.8 Examples

EXAMPLE 1: PATCH to the data object URI to set new field values:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> {
  "mimetype" : "text/plain",
  "metadata" : {
    "colour" : "blue",
    "length" : "10"
  },
  "value" : "This is the Value of this Data Object"
}
<-- HTTP/1.1 204 No Content
```

EXAMPLE 2: PATCH to the data object URI to set a new MIME type:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?mimetype HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> {
  "mimetype" : "text/plain"
}
<-- HTTP/1.1 204 No Content
```

EXAMPLE 3: PATCH to the data object URI to update a range of the value:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?value=21-24 HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> {
  "value" : "dGhhdA=="
}
<-- HTTP/1.1 204 No Content
```

When updating a value without specifying a value transfer encoding, the client must be aware of the current value transfer encoding of the object.

- If a client sends a value containing a UTF-8 string that is not a valid base 64 string to update an existing object with a value transfer encoding of "base64", the server shall return an error.
- If a client sends a value containing a base 64 string to update an existing object with a value transfer encoding of "utf-8", the server shall not return an error. Instead, the server shall store the literal base 64 character sequence in the data object instead of the data encoded in the base 64 string.
EXAMPLE 4: PATCH to the data object URI to replace all metadata with new metadata:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
-->
--> {  
-->   "metadata" : {  
-->     "colour" : "red",
-->     "number" : "?"
-->   }
--> }
<= HTTP/1.1 204 No Content
```

EXAMPLE 5: PATCH to the data object URI to add a new metadata item while preserving existing metadata:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=shape HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
-->
--> {  
-->   "metadata" : {  
-->     "shape" : "round"
-->   }
--> }
<= HTTP/1.1 204 No Content
```

EXAMPLE 6: PATCH to the data object URI to replace just one metadata item with a new value:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=colour HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
-->
--> {  
-->   "metadata" : {  
-->     "colour" : "green"
-->   }
--> }
<= HTTP/1.1 204 No Content
```

EXAMPLE 7: Delete a single metadata item:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=colour HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
-->
--> {  
-->   "metadata": {}  
--> }
<= HTTP/1.1 204 No Content
```
EXAMPLE 8: Add, update, and delete metadata items. Assume a starting condition where the object has a metadata item “colour” with value “green” and a metadata item “shape” with value “round” and does not have a metadata item “size”. After the update, “colour” has value “red”, “shape” is deleted, and “size” has been added with value “10”.

```bash
-- PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=colour&metadata=shape&metadata=size HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> 
--> "metadata": {
-->   "colour": "red",
-->   "size": "10"
--> }
<-- HTTP/1.1 204 No Content
```

EXAMPLE 9: PATCH to the data object URI to set new field values and the binary contents using multi-part MIME:

```bash
-- PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: multipart/mixed; boundary=gc0p4JqQOM2Yt08j34c0p
--> 
--> "metadata": {
-->   "colour": "red",
-->   "number": "7"
--> }
--> 
--> Content-Type: application/octet-stream
--> Content-Transfer-Encoding: binary
--> <37 bytes of binary data>
<-- HTTP/1.1 204 No Content
```

EXAMPLE 10: PATCH to the data object URI to replace just one metadata item and update multiple byte ranges within the binary contents of the data object using multi-part MIME:

```bash
-- PATCH /cdmi/2.0.0/MyContainer/BinaryObject.txt?metadata=colour HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: multipart/mixed; boundary=gc0p4JqQOM2Yt08j34c0p
--> 
--> "metadata": {
-->   "colour": "green"
--> }
--> 
--> Content-Type: application/octet-stream
--> Content-Range: bytes 0-10/37
--> <11 bytes of binary data>
<-- HTTP/1.1 204 No Content
```
EXAMPLE 11: PATCH to the data object URI to encrypt an existing object:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
-->
--> {  
-->   "mimetype" : "application/cms",
-->   "metadata" : {
-->     "cdmi_enc_key_id" : "testkey"
-->   }
-->
<-- HTTP/1.1 204 No Content
```

EXAMPLE 12: PATCH to the data object URI to decrypt an existing encrypted object:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyEncryptedObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
-->
--> {  
-->   "mimetype" : "text/plain"
--> }
<-- HTTP/1.1 204 No Content
```
8.6 Delete a data object using CDMI

8.6.1 Synopsis

To delete an existing data object, the following requests shall be performed:

- DELETE <root URI>/<ContainerName>/<DataObjectName>
- DELETE <root URI>/cdmi_objectid/<DataObjectID>

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers.
- <DataObjectName> is the name of the data object to be deleted.
- <DataObjectID> is the ID of the data object to be deleted.

8.6.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 45.

Table 45: Capabilities - Delete a CDMI data object using CDMI

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_delete_dataobject</td>
<td>Data Object</td>
<td>Ability to delete an existing data object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System Wide Capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

8.6.3 Request headers

Request headers can be provided as per RFC 2616 [23].

8.6.4 Request message body

A request body can be provided as per RFC 2616 [23].

8.6.5 Response headers

Response headers can be provided as per RFC 2616 [23].

8.6.6 Response message body

A response body can be provided as per RFC 2616 [23].

8.6.7 Response status

Table 46 describes the HTTP status codes that occur when deleting a data object using CDMI.
### Table 46: HTTP status codes - Delete a CDMI data object using CDMI

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The data object was successfully deleted.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>

<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server or the data object cannot be deleted.</td>
</tr>
</tbody>
</table>

### 8.6.8 Example

**EXAMPLE 1: DELETE by data object URI:**

```
--> DELETE /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```

**EXAMPLE 2: DELETE by data object ID:**

```
--> DELETE /cdmi/2.0.0/cdmi_objectid/00007ED90010D891022876A8DE0BC0FD HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```
Clause 9

Container Object Resource Operations using CDMI

9.1 Overview

Container objects are the fundamental grouping of stored data within CDMI™ and are analogous to directories within a file system. Each container object has a set of well-defined fields that include:

- zero or more child objects,
- mandatory fields generated by the cloud storage system,
- mandatory metadata items generated by the cloud storage system,
- optional metadata generated by the cloud storage system; and
- optional metadata specified by the cloud user.

All cloud storage systems shall support containers, but the ability to create a container is determined by the presence or absence of the `cdmi_create_container` capability in the parent container.

Each CDMI container object is represented as a JSON object, containing one or more “fields”. For example, the "metadata" field contains metadata items.

EXAMPLE 1: CDMI Container Object

```json
{
  "objectType": "application/cdmi-container",
  "objectID": "00007ED900104E1D14771DC67C27BF8B",
  "objectName": "MyContainer/",
  "parentURI": "/",
  "parentID": "00007E7F0010128E42D87EE34F5A6560",
  "domainURI": "/cdmi_domains/MyDomain/",
  "capabilitiesURI": "/cdmi_capabilities/container/",
  "completionStatus": "Complete",
  "metadata": {
    "cdmi_ctime": "2018-05-16T08:01:02.353Z"
  },
  "childrenrange": "0-4",
  "children": [
    "red",
    "green",
    "yellow",
    "orange/",
    "purple/"
  ]
}
```

The meaning, use, and permitted values of each field is described in each operation that creates, modifies or retrieves CDMI container objects.
9.2 Container object details

9.2.1 Container object addressing

Container objects are addressed in CDMI in two ways:

• by name (e.g. https://cloud.example.com/cdmi/2.0.0/container/); and
• by ID (e.g. https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/
→ 00007ED900104E1D14771DC67C27BF8B/).

Every container object has a single, globally-unique object ID that remains constant for the life of the object. Each
container object may also have one or more URI addresses that allow the container object to be accessed.

When a container object is addressed via more than one unique URIs, all operations may be performed through any of
these URIs. For example, a container object may be accessible via multiple virtual hosting paths, where https:/
/cloud.example.com/users/snia/cdmi/ is also accessible through https://snia.example.com/cdmi/.

Conflicting writes via different paths shall be managed the same way that conflicting writes via one path are managed,
via the principle of eventual consistency (see 9.3).

Following the URI conventions for hierarchical paths, container URIs shall consist of one or more container names that
are separated by forward slashes (“/”) and that end with a forward slash (“/”).

If a request is performed against an existing container resource and the trailing slash at the end of the URI is omitted,
the server shall respond with an HTTP status code of 301 Moved Permanently. In addition, a Location header
containing the URI with the trailing slash added shall be returned.

If a CDMI request is performed to create a new container resource and the trailing slash at the end of the URI is omitted,
the server shall respond with an HTTP status code of 400 Bad Request.

Non-CDMI requests to create a container resource shall include the trailing slash at the end of the URI; otherwise, the
request shall be considered a request to create a data object.

Containers may also be nested.

EXAMPLE 2: The following URI represents a nested container:

https://cloud.example.com/container/subcontainer/

A nested container has a parent container object, shall be included in the children field of the parent container object,
and shall inherit data system metadata and ACLs from its parent container.

This model allows direct mapping between CDMI-managed cloud storage and file systems (e.g., NFSv4 or WebDAV). If
a CDMI container object is exported as a file system, then the file system may make the CDMI metadata accessible via
file system-specific mechanisms. As files and directories are created by the file system, they become visible through the
CDMI interface acting as a data path. The mapping between file system constructs and CDMI data objects, container
objects, and metadata is outside the scope of this International Standard.

9.2.2 Container object fields

Individual fields within a container object may be accessed by specifying the field name after a question mark “?”
appended to the end of the container object URI.

EXAMPLE 3: The following URI returns just the children field in the response body:

https://cloud.example.com/cdmi/2.0.0/container/?children

EXAMPLE 4: By specifying a range after the children field name, specific ranges of the children field may
be accessed.

https://cloud.example.com/cdmi/2.0.0/container/?children=0-2

Children ranges are specified in a way that is similar to byte ranges as per Section 14.35.1 of RFC 2616 [23]. A client can
determine the number of children present by requesting the childrenrange field without requesting a range of children.

A list of fields, separated by an ampersand “&” may be specified, allowing multiple fields to be accessed in a single
request.

EXAMPLE 5: The following URI would return the children and metadata fields in the response body:

https://cloud.example.com/cdmi/2.0.0/container/?children&metadata
When a client provides fields that are not defined in this International Standard or deserializes an object containing fields that are not defined in this International Standard, these fields shall be persisted, but shall not be interpreted.

### 9.2.3 Container object metadata

The following optional container-specific data system metadata may be provided (see Table 47).

<table>
<thead>
<tr>
<th>Metadata Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_assignedsize</td>
<td>JSON string</td>
<td>The number of bytes that is reported via exported protocols (e.g., the device may be thin provisioned). This number may limit cdmi_size.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

Container metadata may also include arbitrary user-supplied metadata, storage system metadata, and data system metadata as described in clause 16.

### 9.2.4 Container object access control

If read access to any of the requested fields is not permitted by the object ACL, only the permitted fields shall be returned. If no requested fields are permitted to be read, an HTTP status code of 403 Forbidden shall be returned to the client. If write access to any of the requested fields is not permitted by the object ACL, no updates shall be performed, and an HTTP status code of 403 Forbidden shall be returned to the client.

### 9.2.5 Reserved container object names

This International Standard defines reserved container names that should not be used by clients when creating new containers. These container names are reserved for use by this International Standard, and if an attempt is made to create or delete them, an HTTP status code of 400 Bad Request shall be returned to the client.

Reserved container names defined in this specification include:

- "cdmi_objectid"
- "cdmi_domains"
- "cdmi_capabilities"
- "cdmi_snapshots"
- "cdmi_versions"

As additional names may be added in future versions of this International Standard, server implementations shall prevent the creation of user-defined containers if the container name starts with "cdmi_".

### 9.2.6 Container object representations

The representations in this clause are shown using JSON notation. Both clients and servers shall support UTF-8 JSON representation. The request and response body JSON fields may be specified or returned in any order, with the exception that, if present, for container objects, the "childrenrange" and "children" fields shall appear last and in that order.
9.3 Create a container object using CDMI

9.3.1 Synopsis

To create a new container object, the following request shall be performed:

- PUT <root URI>/<ContainerName>/<NewContainerName>/

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate container objects that already exist, with one slash (i.e., "/") between each pair of container object names.
- <NewContainerName> is the name specified for the container object to be created.

After it is created, the container object shall also be accessible at <root URI>/cdmi_objectid/<objectID>/.

9.3.2 Delayed completion of create

In response to a create operation for a container object, the server may return an HTTP status code of 202 Accepted to indicate that the object is in the process of being created. This response is useful for long-running operations (e.g., deserializing a source data object to create a large container object hierarchy). Such a response has the following implications.

- The server shall return a Location header with an absolute URI to the object to be created along with an HTTP status code of 202 Accepted.
- With an HTTP status code of 202 Accepted, the server implies that the following checks have passed:
  - user authorization for creating the container object;
  - user authorization for read access to any source object for move, copy, serialize, or deserialize; and
  - availability of space to create the container object or at least enough space to create a URI to report an error.
- A client might not be able to immediately access the created object, e.g., due to delays resulting from the implementation’s use of eventual consistency.

The client performs GET operations to the URI to track the progress of the operation. In response, the server returns two fields in its response body to indicate progress.

- A mandatory completionStatus text field contains either "Processing", "Complete", or an error string starting with the value "Error".
- An optional percentComplete field contains the percentage that the accepted PUT has completed (0 to 100).

GET does not return any children for the container object when completionStatus is not "Complete".

When the final result of the create operation is an error, the URI is created with the completionStatus field set to the error message. It is the client’s responsibility to delete the URI after the error has been noted.
9.3.3 Capabilities

Capabilities that indicate which operations are supported are shown in Table 48.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_create_container</td>
<td>Parent container</td>
<td>Ability to create a new container object</td>
</tr>
<tr>
<td>cdmi_create_reference</td>
<td>Parent container</td>
<td>Ability to create a new reference</td>
</tr>
<tr>
<td>cdmi_copy_container</td>
<td>Parent container</td>
<td>Ability to create a container object that is a copy of another container object</td>
</tr>
<tr>
<td>cdmi_move_container</td>
<td>Parent container</td>
<td>Ability to move a container object from another location</td>
</tr>
<tr>
<td>cdmi_deserialize_container</td>
<td>Parent container</td>
<td>Ability to create a container object that is deserialized from the contents of the PUT or the contents of a data object</td>
</tr>
</tbody>
</table>

9.3.4 Request headers

The HTTP request headers for creating a CDMI container object using CDMI are shown in Table 49.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Header</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

  "application/cdmi-container" or a consistent value described in 5.5.2 | Optional    |
| Content-Type  | Header   | "application/cdmi-container"                                                | Mandatory   |

9.3.5 Request message body

The request message body fields for creating a container object using CDMI are shown in Table 50.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| metadata      | JSON object| Metadata for the container object  

  - If this field is included, the contents of the JSON object provided in this field shall be used as container object metadata.  

  - If this field is included when deserializing, serializing, copying, or moving a container object, the contents of the JSON object provided in this field shall be used as object metadata instead of the metadata from the source URI.  

  - If this field is not included, no user-specified metadata shall be added to the object.  

  - If this field is not included when deserializing, serializing, copying, or moving a container object, metadata from the source URI shall be used.  

  - This field shall not be included when creating a reference to a container object. | Optional |
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainURI</td>
<td>JSON string</td>
<td>URI of the owning domain&lt;br&gt;• If different from the parent domain, the user shall have the &quot;cross-domain&quot; privilege (see cdmig_member_privileges in Table 80).&lt;br&gt;• If not specified, the existing domain shall be preserved.</td>
<td>Optional</td>
</tr>
<tr>
<td>exports</td>
<td>JSON object</td>
<td>A structure for each protocol enabled for this container object (see clause 13). This field shall not be included when referencing a container object.</td>
<td>Optional</td>
</tr>
<tr>
<td>deserialize</td>
<td>JSON string</td>
<td>URI of a CDMI data object with a value that contains a container object serialized as specified in clause 15. The serialized container object shall be deserialized to create the new container object, including all child objects. When deserializing a container object, any exported protocols from the original serialized container object are not applied to the newly created container object(s).</td>
<td>Optional</td>
</tr>
<tr>
<td>copy</td>
<td>JSON string</td>
<td>URI of a source CDMI container object that shall be copied into the new destination container object.&lt;br&gt;• If the destination container object URI and the copy source object URI both do not specify individual fields, the destination container object shall be a complete copy of the source container object, including all child objects under the source container object.&lt;br&gt;• If the destination container object URI or the copy source object URI specifies individual fields, only the fields specified shall be used to create the destination container object. If specified fields are not present in the source, default field values shall be used.&lt;br&gt;• If the destination container object URI and the copy source object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client. When copying a container object, exported protocols are not preserved across the copy.&lt;br&gt; If there are insufficient permissions to read the container object at the source URI or create the container object at the destination URI, or if the read operation fails, the copy shall return an HTTP status code of 400 Bad Request, and the destination container object shall not be created.</td>
<td>Optional</td>
</tr>
<tr>
<td>move</td>
<td>JSON string</td>
<td>URI of an existing local or remote CDMI container object (source URI) that shall be relocated, along with all child objects, to the URI specified in the PUT. The contents of the container object and all children, including the object ID, shall be preserved by a move, and the container object and all children of the source URI shall be removed after the objects at the destination have been successfully created.&lt;br&gt; If there are insufficient permissions to read the objects at the source URI, write the objects at the destination URI, or delete the objects at the source URI, or if any of these operations fail, the move shall return an HTTP status code of 400 Bad Request, and the source and destination are left unchanged.</td>
<td>Optional</td>
</tr>
<tr>
<td>reference</td>
<td>JSON string</td>
<td>URI of a CDMI container object that shall be redirected to by a reference. If other fields are supplied when creating a reference, the server shall respond with an HTTP status code of 400 Bad Request.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
Table 50 – continued from previous page

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>deserializevalue</td>
<td>JSON</td>
<td>A container object serialized as specified in clause 15 and encoded using base 64 encoding rules described in RFC 4648 [19], that shall be deserialized to create the new container object, including all child objects.</td>
<td>Optional1</td>
</tr>
</tbody>
</table>

9.3.6 Response headers

The HTTP response headers for creating a CDMI container object using CDMI are shown in Table 51.

Table 51: Response headers - Create a container object using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>&quot;application/cdmi-container&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Location</td>
<td>Header string</td>
<td>When an HTTP status code of 202 Accepted is returned, the server shall respond with the absolute URL of the object that is in the process of being created.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

9.3.7 Response message body

The response message body fields for creating a CDMI container object using CDMI are shown in Table 52.

Table 52: Response message body - Create a container object using CDMI

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>JSON</td>
<td>&quot;application/cdmi-container&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectID</td>
<td>JSON</td>
<td>Object ID of the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectName</td>
<td>JSON</td>
<td>Name of the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parentURI</td>
<td>JSON</td>
<td>URI for the parent object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parentID</td>
<td>JSON</td>
<td>Object ID of the parent container object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>domainURI</td>
<td>JSON</td>
<td>URI of the owning domain</td>
<td>Mandatory</td>
</tr>
<tr>
<td>capabilitiesURI</td>
<td>JSON</td>
<td>URI to the capabilities for the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>completionStatus</td>
<td>JSON</td>
<td>A string indicating if the object is still in the process of being created or updated by another operation, and after that operation is complete, indicates if it was successfully created or updated or if an error occurred. The value shall be the string &quot;Processing&quot;, the string &quot;Complete&quot;, or an error string starting with the value &quot;Error&quot;.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Continued on next page

1 Only one of these fields shall be specified in any given operation. Except for value, these fields shall not be stored. If more than one of these fields is supplied, the server shall respond with an HTTP status code of 400 Bad Request.
Table 52 – continued from previous page

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| percentComplete  | JSON string   | A string indicating the percentage of completion if the object is still in the process of being created or updated by another operation.  
- When the value of completionStatus is "Processing", this field, if provided, shall indicate the percentage of completion as a numeric integer value from "0" through "100".  
- When the value of completionStatus is "Complete", this field, if provided, shall contain the value "100".  
- When the value of completionStatus is "Error", this field, if provided, may contain any integer value from "0" through "100". | Optional    |
| metadata         | JSON object   | Metadata for the container object. This field includes any user and data system metadata specified in the request body metadata field, along with storage system metadata generated by the cloud storage system. See clause 16 for a further description of metadata. | Mandatory   |
| exports          | JSON object   | A structure for each protocol that is enabled for this container object. See clause 13.                                                                                                                   | Optional2   |
| snapshots        | JSON array of JSON strings | URI(s) of the snapshot container objects. See clause 14.                                                                                                                                                   | Optional2   |
| childrenrange    | JSON string   | The children of the container expressed as a range. If a range of children is requested, this field indicates the children returned as a range.  
This field should not be returned in the response message body that is associated with a copy, move, deserialize, or deserialize value operation. | Optional    |
| children         | JSON array of JSON strings | Names of the children objects in the container object. Child container objects end with "/".  
This field should not be returned in the response message body that is associated with a copy, move, deserialize, or deserialize value operation. | Optional    |

### 9.3.8 Response status

Table 53 describes the HTTP status codes that occur when creating a container object using CDMI.

<table>
<thead>
<tr>
<th>HTTP status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201 Created</td>
<td>The new container object was created.</td>
</tr>
<tr>
<td>202 Accepted</td>
<td>The container is in the process of being created. The CDMI client should monitor the completionStatus and percentComplete fields to determine the current status of the operation.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or had caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

2 Returned only if present.
9.3.9 Examples

EXAMPLE 1: Create a new container with no metadata:

```
--> PUT /cdmi/2.0.0/MyContainer/ HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-container
--> Content-Type: application/cdmi-container

<-- HTTP/1.1 201 Created
<-- Content-Type: application/cdmi-container
<--
<-- { 
<--  "objectType": "application/cdmi-container",
<--  "objectId": "00007ED900104E1D14771DC67C27BF8B",
<--  "objectName": "MyContainer/",
<--  "parentURI": "/",
<--  "parentID": "00007E7F0010128E42D87EE34F5A6560",
<--  "domainURI": "/cdmi_domains/MyDomain/",
<--  "capabilitiesURI": "/cdmi_capabilities/container/",
<--  "completionStatus": "Complete",
<--  "metadata": {
<--    ...
<--  },
<-->  "childrenrange": "",
<-->  "children": []
```

EXAMPLE 2: Create a container with metadata:

```
--> PUT /cdmi/2.0.0/MyContainer/ HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-container
--> Content-Type: application/cdmi-container

<-- HTTP/1.1 201 Created
<-- Content-Type: application/cdmi-container
<--
<-- { 
<--  "metadata": {
<-->    "Colour": "Yellow"
<-->  }
<--
<-- }
```
EXAMPLE 3: Create a container that is a copy of a container:

```plaintext
-- PUT /cdmi/2.0.0/MyContainerCopy/ HTTP/1.1
-- Host: cloud.example.com
-- Accept: application/cdmi-container
-- Content-Type: application/cdmi-container
--
-- 
-- HTTP/1.1 201 Created
-- Content-Type: application/cdmi-container
--
--
-- { 
--  
--  }
```

EXAMPLE 4: Rename a container:

```plaintext
-- PUT /cdmi/2.0.0/MyContainerRenamed/ HTTP/1.1
-- Host: cloud.example.com
-- Accept: application/cdmi-container
-- Content-Type: application/cdmi-container
--
-- { 
--  
--  }
--
-- HTTP/1.1 201 Created
-- Content-Type: application/cdmi-container
--
--
-- 
-- { 
-- 
-- }
```
9.4 Read a container object using CDMI

9.4.1 Synopsis

To read an existing container object, the following requests shall be performed:

- **GET** `<root URI>/<ContainerName>/<TheContainerName>/`
- **GET** `<root URI>/<ContainerName>/<TheContainerName>/?<fieldname>&<fieldname>&...
- **GET** `<root URI>/<ContainerName>/<TheContainerName>/?children=<range>&...
- **GET** `<root URI>/cdmi_objectid/<ContainerObjectID>/`
- **GET** `<root URI>/cdmi_objectid/<ContainerObjectID>/?<fieldname>&<fieldname>&...
- **GET** `<root URI>/cdmi_objectid/<ContainerObjectID>/?children=<range>&...
- **GET** `<root URI>/cdmi_objectid/<ContainerObjectID>/?metadata=<prefix>&...

Where:

- `<root URI>` is the path to the CDMI cloud.
- `<ContainerName>` is zero or more intermediate container objects.
- `<TheContainerName>` is the name specified for the container object to be read from.
- `<fieldname>` is the name of a field.
- `<range>` is a numeric range within the list of children.
- `<prefix>` is a matching prefix that returns all metadata items that start with the prefix value.
- `<ContainerObjectID>` is the ID of the data object to be read from.

9.4.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 54.

Table 54: Capabilities - Read a CDMI Container Object using CDMI

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_read_metadata</td>
<td>Container object</td>
<td>Ability to read the metadata of an existing container object</td>
</tr>
<tr>
<td>cdmi_list_children</td>
<td>Container object</td>
<td>Ability to list the children of an existing container object</td>
</tr>
<tr>
<td>cdmi_list_children_range</td>
<td>Container object</td>
<td>Ability to list a specific range of children of an existing container object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

9.4.3 Request headers

The HTTP request headers for reading a CDMI container object using CDMI are shown in Table 55.

Table 55: Request headers - Read a container object using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Header string</td>
<td>&quot;application/cdmi-container&quot; or a consistent value as described in 5.5.2</td>
<td>Optional</td>
</tr>
</tbody>
</table>
9.4.4 Request message body

A request body shall not be provided.

9.4.5 Response headers

The HTTP response headers for reading a CDMI container object using CDMI are shown in Response headers - Read a container object using CDMI.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>“application/cdmi-container”</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Location</td>
<td>Header string</td>
<td>The server shall respond with an absolute URI to which the reference redirects if the object is a reference.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

9.4.6 Response message body

The response message body fields for reading a CDMI container object using CDMI are shown in Table 57

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>JSON string</td>
<td>“application/cdmi-container”</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectID</td>
<td>JSON string</td>
<td>Object ID of the object</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
| objectName | JSON string | Name of the object  
  • For objects in a container, the objectName field shall be returned.  
  • For objects not in a container (objects that are only accessible by ID), the "objectName" field does not exist and shall not be returned. | Conditional   |
| parentURI  | JSON string | URI for the parent object  
  • For objects in a container, the parentURI field shall be returned.  
  • For objects not in a container (objects that are only accessible by ID), the "parentURI" field does not exist and shall not be returned.  
  Appending the "objectName" to the "parentURI" shall always produce a valid URI for the object. | Conditional   |
| parentID   | JSON string | Object ID of the parent container object  
  • For objects in a container, the "parentID" field shall be returned.  
  • For objects not in a container (objects that are only accessible by ID), the "parentID" field does not exist and shall not be returned. | Conditional   |
| domainURI  | JSON string | URI of the owning domain                                                     | Mandatory     |
| capabilitiesURI | JSON string | URI to the capabilities for the object                                         | Mandatory     |
### Table 57 – continued from previous page

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| completionStatus | JSON string | A string indicating if the object is still in the process of being created or updated by another operation, and after that operation is complete, indicates if it was successfully created or updated or if an error occurred.  
  The value shall be the string "Processing", the string "Complete", or an error string starting with the value "Error". | Mandatory       |
| percentComplete  | JSON string | A string indicating the percentage of completion if the object is still in the process of being created or updated by another operation.  
  • When the value of completionStatus is "Processing", this field, if provided, shall indicate the percentage of completion as a numeric integer value from 0 through 100.  
  • When the value of completionStatus is "Complete", this field, if provided, shall contain the value "100".  
  • When the value of completionStatus is "Error", this field, if provided, may contain any integer value from "0" through "100". | Optional        |
| metadata         | JSON object | Metadata for the container object. This field includes any user and data system metadata specified in the request body metadata field, along with storage system metadata generated by the cloud storage system. See clause 16 for a further description of metadata. | Mandatory       |
| exports          | JSON object | A structure for each protocol that is enabled for this container object (see clause 13)                                                                                                                                 | Optional¹       |
| snapshots        | JSON array of JSON strings | URIs of the snapshot container objects                                                                                                                                                                      | Optional¹       |
| childrenrange    | JSON string | The children of the container expressed as a range. If a range of children is requested, this field indicates the children returned as a range.                                                                                                     | Mandatory       |
| children         | JSON array of JSON strings | Names of the children objects in the container object. When a client uses a child name in a request URI or a header URI, the client shall escape reserved characters according to RFC 3986 [2], e.g., a "s" character in a child name shall be replaced with "%25".  
  • Children that are container objects shall have "/" appended to the child name.  
  • Children that are references shall have "?" appended to the child name.                                                                                         | Mandatory       |

If individual fields are specified in the GET request, only these fields are returned in the result body. Optional fields that are requested but do not exist are omitted from the result body.

### 9.4.7 Response status

Table 58 describes the HTTP status codes that occur when reading a container object using CDMI.

¹ Returned only if present.
Table 58: HTTP status codes - Read a container object using CDMI

<table>
<thead>
<tr>
<th>HTTP status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 OK</td>
<td>The metadata for the container object is provided in the message body.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>406 Not Acceptable</td>
<td>The server is unable to provide the object in the content type specified in the Accept header.</td>
</tr>
</tbody>
</table>

9.4.8 Examples

EXAMPLE 1: GET to the container object URI to read all the fields of the container object:

```plaintext
--- GET /cdmi/2.0.0/MyContainer/ HTTP/1.1
--- Host: cloud.example.com
--- Accept: application/cdmi-container

HTTP/1.1 200 OK
Content-Type: application/cdmi-container

{ 
  "objectType": "application/cdmi-container",
  "objectID": "00007ED900104E1D14771DC67C27BF8B",
  "objectName": "MyContainer/",
  "parentURI": "/",
  "parentID": "00007E7F0010128E42D87EE34F5A6560",
  "domainURI": "/cdmi_domains/MyDomain/",
  "capabilitiesURI": "/cdmi_capabilities/container/",
  "completionStatus": "Complete",
  "metadata": {
    ...
  },
  "exports": {
    "OCCI/iSCSI": {
      "identifier": "00007E7F00104BE66AB53A9572F9FS1E",
      "permissions": [
        "https://example.com/compute/0/",
        "https://example.com/compute/1/"
      ]
    },
    "Network/NFSv4": {
      "identifier": "/users",
      "permissions": "domain"
    },
    "childrenrange": "0-4",
    "children": [
      "red",
      "green",
      "yellow",
      "orange/",
      "purple/"
    ]
  }
}
```
EXAMPLE 2: GET to the container object URI to read parentURI and children of the container object:

```http
-> GET /cdmi/2.0.0/MyContainer/?parentURI&children HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-container

<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-container
<--
<-- {  
<--  "parentURI" : "/",  
<--  "children" : [  
<--   "red",  
<--   "green",  
<--   "yellow",  
<--   "orange/",  
<--   "purple/"]
<-- }  
```

EXAMPLE 3: GET to the container object URI to read children 0..2 and childrenrange of the container object:

```http
-> GET /cdmi/2.0.0/MyContainer/?childrenrange&children=0-2 HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-container

<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-container
<--
<-- {  
<--  "childrenrange" : "0-2",  
<--  "children" : [  
<--   "red",  
<--   "green",  
<--   "yellow"
<-- ]}
```

EXAMPLE 4: GET to the container object by ID to read children 0..2 and childrenrange of the container object:

```http
-> GET /cdmi/2.0.0/cdmi_objectid/0000706D0010B84FAD185C425D8B537E/?childrenrange&children=0-2 HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-container

<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-container
<--
<-- {  
<--  "childrenrange" : "0-2",  
<--  "children" : [  
<--   "red",  
<--   "green",  
<--   "yellow"
<-- ]}
```
9.5 Update a container object using CDMI

9.5.1 Synopsis

To update part or all of an existing container object, the following requests shall be performed:

- \(\text{PATCH} \ <\text{root URI}>/\langle\text{ContainerName}\rangle/\langle\text{TheContainerName}\rangle\)
- \(\text{PATCH} \ <\text{root URI}>/\langle\text{ContainerName}\rangle/\langle\text{TheContainerName}\rangle?\text{metadata=metadataName}&...\)
- \(\text{PATCH} \ <\text{root URI}>/\text{cdmi_objectid}/\langle\text{ContainerObjectID}\rangle\)
- \(\text{PATCH} \ <\text{root URI}>/\text{cdmi_objectid}/\langle\text{ContainerObjectID}\rangle?\text{metadata=metadataName}&...\)

Where:

- \(<\text{root URI}>\) is the path to the CDMI cloud.
- \(<\text{ContainerName}>\) is zero or more intermediate container objects.
- \(<\text{TheContainerName}>\) is the name of the container object to be updated.
- \(<\text{ContainerObjectID}>\) is the ID of the data object to be updated.

9.5.2 Delayed completion of snapshot

If the creation of a snapshot (see clause 14) is requested by including a snapshot field in the request message body, the server may return an HTTP status code of 202 Accepted. Such a response has the following implications:

- With an HTTP status code of 202 Accepted, the server implies that the following checks have passed:
  - user authorization for creating the snapshot,
  - user authorization for read access to the container object, and
  - availability of space to create the snapshot or at least enough space to create a URI to report an error.
- A client might not be able to immediately access the snapshot, e.g., due to delays resulting from the implementation’s use of eventual consistency.

The client performs GET operations to the snapshot URI to track the progress of the operation. In particular, the server returns two fields in its response body to indicate progress:

- A completionStatus field contains either “Processing”, “Complete”, or an error string starting with the value “Error”.
- An optional percentComplete field contains the percentage that the accepted PATCH has completed (“0” to “100”). GET does not return any value for the object when completionStatus is not “Complete”.

When the final result of the snapshot operation is an error, the snapshot URI is created with the completionStatus field set to the error message. It is the client’s responsibility to delete the URI after the error has been noted.
9.5.3 Capabilities

Capabilities that indicate which operations are supported are shown in Table 59.

Table 59: Capabilities - Update a CDMI container object using CDMI

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_modify_metadata</td>
<td>Container object</td>
<td>Ability to modify the metadata of an existing container object</td>
</tr>
<tr>
<td>cdmi_snapshot</td>
<td>Container object</td>
<td>Ability to create a new snapshot of an existing container object</td>
</tr>
<tr>
<td>cdmi_export_&lt;protocol&gt;</td>
<td>Container object</td>
<td>Ability to add and modify exports for an existing container object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

9.5.4 Request headers

The HTTP request headers for updating a CDMI container object using CDMI are shown in Table 60.

Table 60: Request headers - Update a container object using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>&quot;application/cdmi-container&quot;</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

9.5.5 Request message body

The request message body fields for updating a container object using CDMI are shown in Table 61.

Table 61: Request message body - Update a container object using CDMI

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata</td>
<td>JSON object</td>
<td>Metadata for the container object. If present, the new metadata specified replaces the existing object metadata. If individual metadata items are specified in the URI, only those items are replaced; other items are preserved. See clause 16 for a further description of metadata.</td>
<td>Optional</td>
</tr>
<tr>
<td>domainURI</td>
<td>JSON string</td>
<td>URI of the owning domain. If different from the parent domain, the user shall have the &quot;cross-domain&quot; privilege (see cdmi member privileges in Table 80). If not specified, the parent domain shall be used.</td>
<td>Optional</td>
</tr>
<tr>
<td>Field Name</td>
<td>Type</td>
<td>Description</td>
<td>Requirement</td>
</tr>
<tr>
<td>------------</td>
<td>----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| snapshot   | JSON     | Name of the snapshot to be taken. This is not a URL, but rather, the final component of the absolute URL where the snapshot will exist when the snapshot operation successfully completes.  
  - If a snapshot is added or changed, the PATCH operation only returns after the snapshot is added to the snapshot list.  
  - After they are created, snapshots may be accessed as children container objects under the `cdmi_snapshots` child container object of the container object receiving a snapshot.  
  - When creating a snapshot with the same name as an existing snapshot, the new snapshot will replace the existing snapshot. | Optional    |
| deserialize| JSON     | URI of a CDMI data object with a value that contains a container object serialized as specified in clause 15. The serialized container object shall be deserialized to update the existing container object.  
  The object ID of the serialized container object shall match the object ID of the destination container object. Otherwise, the server shall return an HTTP status code of 400 Bad Request.  
  - If the serialized container object does not contain children, the update is applied only to the container object, and any existing children are left as is.  
  - If the serialized container object does contain children, then creates, updates, and deletes are recursively applied for each child, depending on the differences between the provided serialized state and the current state of the child. | Optional    |
| copy       | JSON     | URI of a CDMI container object that shall be copied into the existing container object. Only the contents of the container object itself shall be copied, not any children of the container object.  
  - If the destination container object URI and the copy source object URI both do not specify individual fields, the destination container object shall be replaced with the source container object, including all child objects under the source container object.  
  - If the destination container object URI or the copy source object URI specifies individual fields, only the fields specified shall be used to update the destination container object. If specified fields are not present in the source, these fields shall be ignored.  
  - If the destination container object URI and the copy source object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client.  
  When copying a container object, exported protocols are not preserved across the copy.  
  If there are insufficient permissions to read the container object at the source URI or create the container object at the destination URI, or if the read operation fails, the copy shall return an HTTP status code of 400 Bad Request, and the destination container object shall not be updated. | Optional    |
### Table 61 – continued from previous page

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>deserializevalue</code></td>
<td><code>string</code></td>
<td>A container object serialized as specified in clause 15 and encoded using base 64 encoding rules described in RFC 4648 [19], that shall be deserialized to update the existing container object. The object ID of the serialized container object shall match the object ID of the destination container object. Otherwise, the server shall return an HTTP status code of 400 Bad Request.  • If the serialized container object does not contain children, the update is applied only to the container object, and any existing children are left as is.  • If the serialized container object does contain children, then creates, updates, and deletes are recursively applied for each child, depending on the differences between the provided serialized state and the current state of the children.</td>
<td>Optional ^1</td>
</tr>
<tr>
<td><code>exports</code></td>
<td><code>JSON object</code></td>
<td>A structure for each protocol that is enabled for this container object (see clause 13). If an exported protocol is added or changed, the PATCH operation only returns after the export operation has completed.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

^1 Only one of these fields shall be specified in any given operation. Except for value, these fields shall not be stored.
9.5.6 Response headers

The HTTP response header for updating a CDMI container object using CDMI is shown in Table 62.

Table 62: Response header - Update a container object using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>Header string</td>
<td>The server shall respond with an absolute URI to which the reference redirects if the object is a reference.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

9.5.7 Response message body

A response body can be provided as per RFC 2616 [23].

9.5.8 Response status

Table 63 describes the HTTP status codes that occur when updating a container object using CDMI.

Table 63: HTTP status codes - Update a container object using CDMI

<table>
<thead>
<tr>
<th>HTTP status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The data object content was returned in the response.</td>
</tr>
<tr>
<td>202 Accepted</td>
<td>The container or snapshot (subcontainer object) is in the process of being created. The CDMI client should monitor the completionStatus and percentComplete fields to determine the current status of the operation.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

9.5.9 Examples

EXAMPLE 1: PATCH to the container object URI to replace all metadata with new metadata:

```plaintext
---> PATCH /cdmi/2.0.0/MyContainer/ HTTP/1.1
---> Host: cloud.example.com
---> Content-Type: application/cdmi-container
-->
---> {  
  ---> "metadata": {  
  ---> "colour": "red",
  ---> "number": "7"
  -->
-->
<=- HTTP/1.1 204 No Content
```
EXAMPLE 2: PATCH to the container object URI to set a new exported protocol value:

```
--> PATCH /cdmi/2.0.0/MyContainer/?exports HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-container

--> {  
-->   "exports": {  
-->     "OCCI/iSCSI": {  
-->       "identifier": "00007ED900104E1D14771DC67C27BF8B",  
-->       "permissions": "00007E7F00104EB781F900791C70106C"  
-->     },  
-->     "Network/NFSv4": {  
-->       "identifier": "/users",  
-->       "permissions": "domain"  
-->     }  
-->   }  

<-- HTTP/1.1 204 No Content
```
9.6 Delete a container object using CDMI

9.6.1 Synopsis

To delete an existing container object, including all contained children and snapshots, the following requests shall be performed:

- DELETE <root URI>/<ContainerName>/<TheContainerName>
- DELETE <root URI>/cdmi_objectid/<ContainerObjectID>

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate container objects.
- <TheContainerName> is the name of the container object to be deleted.
- <ContainerObjectID> is the ID of the container object to be deleted.

9.6.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 64.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_delete_container</td>
<td>Container object</td>
<td>Ability to delete an existing container object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

9.6.3 Request headers

Request headers can be provided as per RFC 2616 [23].

9.6.4 Request message body

A request body can be provided as per RFC 2616 [23].

9.6.5 Response headers

Response headers can be provided as per RFC 2616 [23].

9.6.6 Response message body

A response body can be provided as per RFC 2616 [23].

9.6.7 Response status

Table 65 describes the HTTP status codes that occur when deleting a container object using CDMI.
### Table 65: HTTP status codes - Delete a container object using CDMI

<table>
<thead>
<tr>
<th>HTTP status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The container object was successfully deleted.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

#### 9.6.8 Example

**EXAMPLE 1: DELETE to the container object URI:**

```plaintext
--> DELETE /cdmi/2.0.0/MyContainer/ HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```

**EXAMPLE 2: DELETE by container object ID:**

```plaintext
--> DELETE /cdmi/2.0.0/cdmi_objectid/00007ED900104E1D14771DC67C27BF8B/ HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```
9.7 Create (POST) a new data object using CDMI

9.7.1 Synopsis

To create a new data object in a specified container, the following request shall be performed:

- POST <root URI>/<ContainerName>/

To create a new data object where the data object does not belong to a container and is only accessible by ID (see 5.3.1), the following request shall be performed:

- POST <root URI>/cdmi_objectid/

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate container objects that already exist, with one slash (i.e., "/") between each pair of container object names.
- <DataObjectName> is the name specified for the data object to be created.

If created in a container, the data object shall be accessible as a child of the container with a server-assigned name, and shall also be accessible at <root URI>/cdmi_objectid/<objectID>.

If created in "/cdmi_objectid/", the data object shall only be accessible at <root URI>/cdmi_objectid/<objectID>.

9.7.2 Delayed completion of create

In response to a create operation for a data object, the server may return an HTTP status code of 202 Accepted to indicate that the object is in the process of being created. This response is useful for long-running operations (e.g., copying a large data object from a source URI). Such a response has the following implications.

- The server shall return a Location header with an absolute URI to the object to be created along with an HTTP status code of 202 Accepted.
- With an HTTP status code of 202 Accepted, the server implies that the following checks have passed:
  - user authorization for creating the object;
  - user authorization for read access to any source object for move, copy, serialize, or deserialize; and
  - availability of space to create the object or at least enough space to create a URI to report an error.
- A client might not be able to immediately access the created object, e.g., due to delays resulting from the implementation's use of eventual consistency.

The client performs GET operations to the URI to track the progress of the operation. In response, the server returns two fields in its response body to indicate progress.

- A mandatory completionStatus text field contains either "Processing", "Complete", or an error string starting with the value "Error".
- An optional percentComplete field contains the percentage of the operation that has completed (0 to 100).

GET shall not return any value for the data object when completionStatus is not "Complete". If the final result of the create operation is an error, the URI is created with the completionStatus field set to the error message. It is the client's responsibility to delete the URI after the error has been noted.
## 9.7.3 Capabilities

Capabilities that indicate which operations are supported are shown in Table 66.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_post_dataobject</td>
<td>Parent container</td>
<td>Ability to create a new data object</td>
</tr>
<tr>
<td>cdmi_create_dataobject</td>
<td>Parent container</td>
<td>Ability to create a new data object</td>
</tr>
<tr>
<td>cdmi_create_reference</td>
<td>Parent container</td>
<td>Ability to create a new reference</td>
</tr>
<tr>
<td>cdmi_copy_dataobject</td>
<td>Parent container</td>
<td>Ability to create a data object that is a copy of another data object</td>
</tr>
<tr>
<td>cdmi_move_dataobject</td>
<td>Parent container</td>
<td>Ability to move a data object from another container</td>
</tr>
<tr>
<td>cdmi_deserialize_dataobject</td>
<td>Parent container</td>
<td>Ability to create a data object that is deserialized from the contents of the PUT or the contents of another data object</td>
</tr>
<tr>
<td>cdmi_serialize_dataobject</td>
<td>Parent container</td>
<td>Ability to create a data object that contains a serialized representation of an existing data object, container, domain or queue</td>
</tr>
<tr>
<td>cdmi_create_value_range</td>
<td>Parent container</td>
<td>Ability to create a data object using a specified byte range</td>

| metadata   | JSON object   | Metadata for the data object  
• If this field is included, the contents of the JSON object provided in this field shall be used as data object metadata.  
• If this field is included when deserializing, serializing, copying, or moving a data object, the contents of the JSON object provided in this field shall be used as object metadata instead of the metadata from the source URI.  
• If this field is not included, no user-specified metadata shall be added to the object.  
• If this field is not included when deserializing, serializing, copying, or moving a data object, metadata from the source URI shall be used.  
• This field shall not be included when creating a reference to a data object.                                                                 | Optional     |
| domainURI  | JSON string   | URI of the owning domain  
• If different from the parent domain, the user shall have the “cross-domain” privilege (see cdmi_member_privileges in Table 80).  
• If not specified, the domain of the parent container shall be used.                                                                 | Optional     |
| deserialize | JSON string   | URI of a CDMI data object with a value that contains a data object serialized as specified in clause 15. The serialized data object shall be deserialized to create the new data object.                                                                                                                                                                                                                                 | Optional      |
| serialize  | JSON string   | URI of a CDMI object that shall be serialized into the new data object  
• If the destination data object URI and the copy source object URI both do not specify individual fields, the destination data object shall be a complete copy of the source data object.  
• If the destination data object URI or the copy source object URI specifies individual fields, only the fields specified shall be used to create the destination data object. If specified fields are not present in the source, default field values shall be used.  
• If the destination data object URI and the copy source object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client.  
• If the copy source object URI points to a queue object, as part of the copy operation, multiple queue values shall be concatenated into a single data object value.  
• If the copy source object URI points to one or more queue object values, as part of the copy operation, the specified queue values shall be concatenated into a single data object value.  
• If there are insufficient permissions to read the data object at the source URI or create the data object at the destination URI, or if the read operation fails, the copy shall return an HTTP status code of 400 Bad Request, and the destination object shall not be created. | Optional      |
| copy       | JSON string   | URI of a source CDMI data object or queue object that shall be copied into the new destination data object.  
• If the destination data object URI and the copy source object URI both do not specify individual fields, the destination data object shall be a complete copy of the source data object.  
• If the destination data object URI or the copy source object URI specifies individual fields, only the fields specified shall be used to create the destination data object. If specified fields are not present in the source, default field values shall be used.  
• If the destination data object URI and the copy source object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client.  
• If the copy source object URI points to a queue object, as part of the copy operation, multiple queue values shall be concatenated into a single data object value.  
• If the copy source object URI points to one or more queue object values, as part of the copy operation, the specified queue values shall be concatenated into a single data object value.  
• If there are insufficient permissions to read the data object at the source URI or create the data object at the destination URI, or if the read operation fails, the copy shall return an HTTP status code of 400 Bad Request, and the destination object shall not be created. | Optional      |

<td>--------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>completionStatus</td>
<td>JSON</td>
<td>A string indicating if the object is still in the process of being created or updated by another operation, and after that operation is complete, indicates if it was successfully created or updated or if an error occurred. The value shall be the string &quot;Processing&quot;, the string &quot;Complete&quot;, or an error string starting with the value &quot;Error&quot;.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
| percentComplete | JSON   | A string indicating the percentage of completion if the object is still in the process of being created or updated by another operation.  
• When the value of completionStatus is "Processing", this field, if provided, shall indicate the percentage of completion as a numeric integer value from "0" through "100".  
• When the value of completionStatus is "Complete", this field, if provided, shall contain the value "100".  
• When the value of completionStatus is "Error", this field, if provided, may contain any integer value from "0" through "100". | Optional    |
| mimetype        | JSON   | MIME type of the value of the data object                                                                                                             | Mandatory   |
| metadata        | JSON   | Metadata for the data object. This field includes any user and data system metadata specified in the request body metadata field, along with storage system metadata generated by the cloud storage system. See clause 16 for a further description of metadata. | Mandatory   |

### 9.7.8 Response status

Table 71 describes the HTTP status codes that occur when creating a new data object using CDMI.

<table>
<thead>
<tr>
<th>HTTP status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201 Created</td>
<td>The new data object was created.</td>
</tr>
<tr>
<td>202 Accepted</td>
<td>The data object is in the process of being created. The CDMI client should monitor the completionStatus and percentComplete fields to determine the current status of the operation.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

### 9.7.9 Examples

**EXAMPLE 1: POST to the container object URI the data object contents:**

```bash
--> POST /cdmi/2.0.0/MyContainer/ HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object
--> Content-Type: application/cdmi-object
<--
<-- { (continues on next page) ```
Cloud Data Management Interface 2.0.0a

(continued from previous page)

```json
--> "mimetype": "text/plain",
--> "metadata": {
  --> "value": "This is the Value of this Data Object"
  --> }

HTTP/1.1 201 Created
Content-Type: application/cdmi-object
Location: https://cloud.example.com/cdmi/2.0.0/MyContainer/

```

EXAMPLE 2: POST to the object ID URI the data object contents:

```json
POST /cdmi/2.0.0/cdmi_objectid/ HTTP/1.1
Host: cloud.example.com
Accept: application/cdmi-object
Content-Type: application/cdmi-object

```

```
HTTP/1.1 201 Created
Location: https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/
```

© SNIA 2020
EXAMPLE 3: POST to the object ID URI the data object fields and binary contents using multi-part MIME:

```http
--> POST /cdmi/2.0.0/cdmi_objectid/ HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-object
--> Content-Type: multipart/mixed; boundary=gc0p4Jq0M2Yt08j34c0p
-->
--gc0p4Jq0M2Yt08j34c0p
--> Content-Type: application/cdmi-object
-->
--> 
--> "domainURI": "/cdmi_domains/MyDomain/",
--> "metadata": { 
--> "colour": "blue"
--> }
-->
--gc0p4Jq0M2Yt08j34c0p
--> Content-Type: application/octet-stream
--> Content-Transfer-Encoding: binary
-->
--> <37 bytes of binary data>
-->
--gc0p4Jq0M2Yt08j34c0p--

<-- HTTP/1.1 201 Created
<-- Location: https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/00007ED90010C2414303B5C6D4F83170
<-- Content-Type: application/cdmi-object
<--

```
9.8 Create (POST) a new queue object using CDMI

9.8.1 Synopsis

To create a new queue object (see clause 11) in a specified container where the name of the queue object is a server-assigned object identifier, the following request shall be performed:

• POST <root URI>/<ContainerName>/

To create a new queue object where the queue object does not belong to a container and is only accessible by ID (see 5.3.1), the following request shall be performed:

• POST <root URI>/cdmi_objectid/

Where:

• <root URI> is the path to the CDMI cloud.
• <ContainerName> is zero or more intermediate container objects that already exist, with one slash (i.e., "/") between each pair of container object names.

If created in a container, the queue object shall be accessible as a child of the container with a server-assigned name, and shall also be accessible at <root URI>/cdmi_objectid/<objectID>.

If created in "/cdmi_objectid/", the queue object shall only be accessible at <root URI>/cdmi_objectid/<objectID>.

9.8.2 Delayed completion of create

In response to a create operation for a queue object, the server may return an HTTP status code of 202 Accepted to indicate that the object is in the process of being created. This response is useful for long-running operations (e.g., copying a large number of queue values from a source URI). Such a response has the following implications.

• The server shall return a Location header with an absolute URI to the object to be created along with an HTTP status code of 202 Accepted.

• With an HTTP status code of 202 Accepted, the server implies that the following checks have passed:
  – user authorization for creating the object;
  – user authorization for read access to any source object for move, copy, serialize, or deserialize; and
  – availability of space to create the object or at least enough space to create a URI to report an error.

• A client might not be able to immediately access the created object, e.g., due to delays resulting from the implementation’s use of eventual consistency.

The client performs GET operations to the URI to track the progress of the operation. In response, the server returns two fields in its response body to indicate progress.

• A mandatory completionStatus text field contains either "Processing", "Complete", or an error string starting with the value "Error".

• An optional percentComplete field contains the percentage of the operation that has completed (0 to 100).

GET shall not return any value for the queue object when completionStatus is not "Complete". If the final result of the create operation is an error, the URI is created with the completionStatus field set to the error message. It is the client’s responsibility to delete the URI after the error has been noted.
9.8.3 Capabilities

Capabilities that indicate which operations are supported are shown in Table 72.

Table 72: Capabilities - Create a CDMI Queue object using CDIM

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>

Part IV

CDMI Advanced
Clause 10

Domain object resource operations using CDMI

10.1 Overview

Domain objects represent the concept of administrative ownership of stored data within a CDMI™ storage system. Each object may be owned and managed by a different administrative entity, which is expressed as a domain.

If a cloud storage system supports domains, the `cdmi_domains` system-wide capability shall be present, and the `cdmi_domains` container shall be present in the CDMI root container.

A cloud storage system may include a hierarchy of domains that provide access to domain-related information within a CDMI context. This domain hierarchy is a series of CDMI objects that correspond to parent and child domains, with each domain corresponding to logical groupings of objects that are to be managed together. Domain measurement information about objects that are associated with each domain flow up to parent domains, facilitating billing and management operations that are typical for a cloud storage environment.

Fig. 7 shows the hierarchy of domains and shows how the domainURI links data objects, container objects and queue objects into the domain hierarchy.

Each CDMI domain object is represented as a JSON object, containing one or more “fields”. For example, the “metadata” field contains metadata items.

EXAMPLE 1: CDMI domain object

```json
{
   "objectType" : "application/cdmi-domain",
   "objectID" : "00007E7F00104BE66AB53A9572F9F51E",
   "objectName" : "MyDomain/",
   "parentURI" : "/cdmi_domains/",
   "parentID" : "00007E7F0010C058374D08B0AC7B3550",
}
```

(continues on next page)
"domainURI" : "/cdmi_domains/MyDomain/",
"capabilitiesURI" : "/cdmi_capabilities/domain/",
"metadata" : {
  "cdmi_domain_enabled" : "true",
  "cdmi_authentication_methods" : "anonymous, basic",
  ...
},
"childrenrange" : "0-1",
"children" : [
  "cdmi_domain_summary/",
  "cdmi_domain_members/
]}

The meaning, use, and permitted values of each field is described in each operation that creates, modifies or retrieves CDMI domain objects.
10.2 Domain object details

10.2.1 Domain object addressing

Domain objects are created as children of a special `cdmi_domains` container object, which is present in the root URI for the cloud storage system when domains are supported. The `cdmi_domains` container object is system-generated, read-only, cannot be deleted, and only permits the creation of children domain objects, as indicated by the presence of the `cdmi_create_domain` capability. The ability to create a sub-domain under an existing domain object is indicated by the presence of the `cdmi_create_domain` capability for a given domain object.

Domain objects are addressed in CDMI in two ways:

- by name (e.g., https://cloud.example.com/cdmi/2.0.0/cdmi_domains/myDomain/);
- by ID (e.g., https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/ → 00007ED90010329E642EBFC8B57E9AD/).

Every domain object has a single, globally-unique object ID that remains constant for the life of the object. Each domain object shall also have at least one URI address that allows the domain object to be accessed. Following the URI conventions for hierarchical paths, domain URIs shall start with "<root URI>/cdmi_domains/" and consist of one or more domain names that are separated by forward slashes ("/") and that end with a forward slash ("/").

If a request is performed against an existing domain resource and the trailing slash at the end of the URI is omitted, the server shall respond with an HTTP status code of 301 Moved Permanently, and a "Location" header containing the URI with the trailing slash will be added.

If a CDMI request is performed to create a new domain resource and the trailing slash at the end of the URI is omitted, the server shall respond with an HTTP status code of 400 Bad Request.

Domain objects may also be nested.

EXAMPLE 2: The following URI represents a nested domains:
https://cloud.example.com/cdmi/2.0.0/cdmi_domains/myDomain/subDomain/

A sub-domain has a parent domain object, shall be included in the children field of the parent domain object, and shall inherit Domain Membership from its parent domain (if not specified in the sub-domain).

10.2.2 Domain object fields

Individual fields within a domain object may be accessed by specifying the field name after a question mark "?" appended to the end of the domain object URI.

EXAMPLE 3: The following URI returns just the children field in the response message body:
https://cloud.example.com/cdmi/2.0.0/cdmi_domains/myDomain/?children

EXAMPLE 4: By specifying a range after the children field name, specific ranges of the children field may be accessed.
https://cloud.example.com/cdmi/2.0.0/cdmi_domains/myDomain/?children=0-2

Children ranges are specified in a way that is similar to byte ranges as per Section 14.35.1 of RFC 2616 [23]. A client can determine the number of children present by requesting the `childrenrange` field without requesting a range of children.

A list of fields separated by an ampersand "&" may be specified, allowing multiple fields to be accessed in a single request.

EXAMPLE 5: The following URI would return the children and metadata fields in the response body:
https://cloud.example.com/cdmi/2.0.0/cdmi_domains/myDomain/?children;metadata

When a client provides fields that are not defined in this International Standard or deserializes an object containing fields that are not defined in this International Standard, these fields shall be persisted, but shall not be interpreted.
10.2.3 Domain object metadata

The following domain-specific field shall be present for each domain (see Table 78).

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_domain_enabled</td>
<td>JSON string</td>
<td>Indicates if the domain is enabled and specified at the time of creation. Values shall be &quot;true&quot; or &quot;false&quot;.</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this metadata item is not present at the time of domain creation, the value is set to &quot;false&quot;.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If a domain is disabled, the cloud storage system shall not permit any operations to be performed against any URI managed by that domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• When a domain is disabled, all operations that are performed against URIs that are managed by a disabled domain shall return an HTTP status code of 403 Forbidden.</td>
<td></td>
</tr>
<tr>
<td>cdmi_domain_delete_reassign</td>
<td>JSON string</td>
<td>If the domain is deleted, indicates to which domain the objects that belong to the domain shall be reassigned.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• To delete a domain that contains objects, this metadata item shall be present.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this metadata item is not present or does not contain the URI of a valid domain that is different from the URI of the domain being deleted, an attempt to delete a domain that has objects shall result in an HTTP status code of 400 Bad Request.</td>
<td></td>
</tr>
<tr>
<td>cdmi_authentication_methods</td>
<td>JSON array of JSON strings</td>
<td>Indicates a list of which authentication methods are enabled for the domain. Supported authentication method values are indicated by the cdmi_authentication_methods capability.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

Domains may also contain domain-specific data system metadata items as defined in 16.3 and 16.4. Domain data system metadata shall be inherited to child domain objects.

10.2.4 Domain object access control

If read access to any of the requested fields is not permitted by the object ACL, only the permitted fields shall be returned. If no requested fields are permitted to be read, an HTTP status code of 403 Forbidden shall be returned to the client.

If write access to any of the requested fields is not permitted by the object ACL, no updates shall be performed, and an HTTP status code of 403 Forbidden shall be returned to the client.

10.2.5 Domain usage in access control

When a transaction is performed against a CDMI object, the associated domain object (i.e., the domain object indicated by the domainURI) specifies the authentication context. The user identity and credentials presented as part of the transaction are compared to the domain membership list to determine if the user is authorized within the domain and to resolve the user’s principal. If resolved, the user’s principal is evaluated against the object’s ACL to determine if the transaction is permitted.

When evaluating members within a domain, delegations are evaluated first, in any order, followed by user records, in any order. If there is at least one matching record and none of the matching records indicate that the user is disabled, the user is considered to be a member of the domain.
When a sub-domain is initially created, the membership container contains one member record that is a delegation in which the delegation URI is set to the URI of the parent domain.

10.2.6 Domain object representations

The representations in this clause are shown using JSON notation. Both clients and servers shall support UTF-8 JSON representation. The request and response body JSON fields may be specified or returned in any order, with the exception that, if present, for domain objects, the childrenrange and children fields shall appear last and in that order.
10.3 Domain object summaries

Domain object summaries provide summary measurement information about domain usage and billing. If supported, a domain summary container named "cdmi_domain_summary" shall be present under each domain container. Like any container, the domain summary subcontainer may have an Access Control List (ACL) (see 17.1) that restricts access to this information.

Within each domain summary container are a series of domain summary data objects that are generated by the cloud storage system. The "yearly", "monthly", and "daily" containers of these data objects contain domain summary data objects corresponding to each year, month, and day, respectively. These containers are organized into the following structures:

- https://example.com/cdmi/2.0.0/cdmi_domains/domain/
- https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_summary/cumulative
- https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_summary/daily/2009-07-01
- https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_summary/daily/2009-07-02
- https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_summary/daily/2009-07-03
- https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_summary/monthly/2009-07
- https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_summary/monthly/2009-08
- https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_summary/monthly/2009-10
- https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_summary/yearly/2009
- https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_summary/yearly/2010

The "cumulative" summary data object covers the entire time period, from the time the domain is created to the time it is accessed. Each data object at the daily, monthly, and yearly level contains domain summary information for the time period specified, bounded by domain creation time and access time.

If a time period extends earlier than the domain creation time, the summary information includes the time from when the domain was created until the end of the time period.

EXAMPLE 1: If a domain were created on July 4, 2009, at noon, the daily summary "2009-07-04" would contain information from noon until midnight, the monthly summary "2009-07" would contain information from noon on July 4 until midnight on July 31, and the yearly summary "2009" would contain information from noon on July 4 until midnight on December 31.

If a time period starts after the time when the domain was created and ends earlier than the time of access, the summary data object contains complete information for that time period.

EXAMPLE 2: If a domain were created on July 4, 2009, and on July 10, the "2009-07-06" daily summary data object was accessed, it would contain information for the complete day.

If a time period ends after the current access time, the domain summary data object contains partial information from the start of the time period (or the time the domain was created) until the time of access.

EXAMPLE 3: If a domain were created on July 4, 2009, and at noon on July 10, the "2009-07-10" daily summary data object was accessed, it would contain information from the beginning of the day until noon.
The information in Table 79 shall be present within the contents of each domain summary object, which are in JSON representation.

**EXAMPLE 4:** An example of a daily domain summary object is as follows:

```json
{
    "cdmi_domainURI" : "/cdmi_domains/MyDomain/",
    "cdmi_summary_start" : "2009-12-10T00:00:00",
    "cdmi_summary_end" : "2009-12-10T23:59:59",
    "cdmi_summary_objecthours" : "382239734",
    "cdmi_summary_puts" : "234234",
    "cdmi_summary_gets" : "489432",
    "cdmi_summary_bytehours" : "334895798347",
    "cdmi_summary_writes" : "7218368343",
    "cdmi_summary_reads" : "11283974933",
    "cdmi_summary_charge" : "4289.23 USD"
}
```

If the charge value is provided, the value is for the operational cost (excluding fixed fees) of service already performed and storage and bandwidth already consumed. Pricing of services is handled separately.

Domain summary information may be extended by vendors to include additional metadata or domain reports beyond the metadata items specified by this International Standard, as long as the field names for those metadata items do not begin with "cdmi_".
10.4 Domain object membership

In cloud storage environments, in the same way that domains are often created programmatically, domain user membership and credential mapping also shall be populated using such interfaces. By providing access to user membership, this capability enables self-enrollment, automatic provisioning, and other advanced self-service capabilities, either directly using CDMI or through software systems that interface with CDMI.

The domain membership capability provides information about, and allows the specification of, end users and groups of users that are allowed to access the domain via CDMI and other access protocols. The concept of domain membership is not intended to replace or supplant ACLs (see 17.1), but rather to provide a single, unified place to map identities and credentials to principals used by ACLs within the context of a domain (see model described in 10.2.5). It also provides a place for authentication mappings to external authentication providers, such as LDAP and Active Directory, to be specified.

If supported, a domain membership container named cdmi_domain_members shall be present under each domain. Like any container, the domain membership container has an Access Control List (see 17.1) that restricts access to this information.

Within each domain membership container are a series of user objects that are specified through CDMI to define each user known to the domain. These objects are formatted into the following structure:

```
https://example.com/cdmi/2.0.0/cdmi_domains/domain/
https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_members/
https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_members/john_doe
https://example.com/cdmi/2.0.0/cdmi_domains/domain/cdmi_domain_members/john_smith
```

The domain membership container may also contain subcontainers with data objects. Data objects in these subcontainers are treated the same as data objects in the domain membership container, and no meaning is inferred from the subcontainer name. This organization is used to create different access security relationships for groups of user objects and to allow delegation to a common set of members.

Table 80 lists the domain settings that shall be present within each domain member user object.

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_member_enabled</td>
<td>JSON string</td>
<td>If true, this field indicates that requests associated with this domain member are allowed. If false, all requests performed by this domain member shall result in an HTTP status code of 403 Forbidden.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>cdmi_member_type</td>
<td>JSON string</td>
<td>This field indicates the type of member record. Values include &quot;user&quot;, &quot;group&quot;, and &quot;delegation&quot;.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>cdmi_member_name</td>
<td>JSON string</td>
<td>This field contains the user or group name as presented by the client. This will normally be the standard full name of the principal.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>cdmi_member_credentials</td>
<td>JSON string</td>
<td>This field contains credentials to be matched against the credentials as presented by the client. If this field is not present, one or more delegations shall be present and shall be used to resolve user credentials. As one cannot log in as a group but only as a member of a group, the &quot;group&quot; type member records shall not have credentials.</td>

<td>If true, this field indicates that requests associated with this domain member are allowed. If false, all requests performed by this domain member shall result in an HTTP status code of 403 Forbidden.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>cdmi_member_type</td>
<td>JSON string</td>
<td>This field indicates the type of member record. Values include &quot;user&quot; and &quot;delegation&quot;.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>cdmi_delegation_URI</td>
<td>JSON string</td>
<td>This field contains the URI of an external identity resolution provider (such as LDAP or Active Directory) or the URI of a domain membership container object. Externally, delegations are expressed in the form of ldap://&lt;uri&gt; or ad://&lt;uri&gt;.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
EXAMPLE 1: An example of a domain membership object for a user is as follows:

```json
{
  "cdmi_member_enabled": "true",
  "cdmi_member_type": "user",
  "cdmi_member_name": "John Doe",
  "cdmi_member_credentials": "p+5/oX1cmExfOIrUxhX1lw==",
  "cdmi_member_groups": [
    "Users"
  ],
  "cdmi_member_principal": "jdoe",
  "cdmi_privileges": [
    "administrator",
    "cross_domain"
  ]
}
```

EXAMPLE 2: An example of a domain membership object for a delegation is as follows:

```json
{
  "cdmi_member_enabled": "true",
  "cdmi_member_type": "delegation",
  "cdmi_delegation_URI": "/cdmi_domains/MyDomain/"
}
```
10.5 Create a domain object using CDMI

10.5.1 Synopsis

To create a new domain object, the following request shall be performed:

- PUT <root URI>/cdmi_domains/<DomainName>/<NewDomainName>/

Where:

- <root URI> is the path to the CDMI cloud.
- <DomainName> is zero or more intermediate domains that already exist, with one slash (i.e., "/") between each pair of domain names.
- <NewDomainName> is the name specified for the domain to be created.

After it is created, the domain shall also be accessible at <root URI>/cdmi_objectid/<objectID>/.

10.5.2 Delayed completion of create

Delayed completion shall not be supported for creating domain objects.

10.5.3 Capabilities

Capabilities that indicate which operations are supported are shown in Table 82.

Table 82: Capabilities - Create a CDMI domain object using CDMI

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_create_domain</td>
<td>Parent container</td>
<td>Ability to create a new domain object</td>
</tr>
<tr>
<td>cdmi_copy_domain</td>
<td>Parent container</td>
<td>Ability to create a domain object that is a copy of another domain object</td>
</tr>
<tr>
<td>cdmi_deserialize_domain</td>
<td>Parent container</td>
<td>Ability to create a domain object that is deserialized from the contents of the PUT or the contents of another data object</td>
</tr>
</tbody>
</table>

10.5.4 Request headers

The HTTP request headers for creating a CDMI domain object using CDMI are shown in Table 83.

Table 83: Request headers - Create a domain object using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Header string</td>
<td>&quot;application/cdmi-domain&quot; or a consistent value as described in 5.5.2</td>
<td>Optional</td>
</tr>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>&quot;application/cdmi-domain&quot;</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
### 10.5.5 Request message body

The request message body fields for creating a domain object using CDMI are shown in Table 84.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata</td>
<td>JSON object</td>
<td>Metadata for the domain object</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is included, the contents of the JSON object provided in this field shall be used as domain object metadata.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is included when deserializing, serializing, copying, or moving a domain object, the contents of the JSON object provided in this field shall be used as object metadata instead of the metadata from the source URI.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is not included, no user-specified metadata shall be added to the object.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is not included when deserializing, serializing, copying, or moving a domain object, metadata from the source URI shall be used.</td>
<td></td>
</tr>
<tr>
<td>copy</td>
<td>JSON string</td>
<td>URI of a CDMI domain that shall be copied into the new domain, including all child domains and membership from the source domain</td>
<td>Optional†</td>
</tr>
<tr>
<td>move</td>
<td>JSON string</td>
<td>URI of an existing local CDMI domain object (source URI) that shall be relocated, along with all child domains, to the URI specified in the PUT. The contents of the domain and all sub-domains, including the object ID, shall be preserved by a move, and the domain and sub-domains of the source URI shall be removed after the objects at the destination have been successfully created. If there are insufficient permissions to read the objects at the source URI, write the objects at the destination URI, or delete the objects at the source URI, or if any of these operations fail, the move shall return an HTTP status code of 400 Bad Request, and the source and destination are left unchanged.</td>
<td>Optional†</td>
</tr>
<tr>
<td>deserialize</td>
<td>JSON string</td>
<td>URI of a CDMI data object with a value that contains a domain object serialized as specified in clause 15. The serialized domain object shall be deserialized to create the new domain object, including all child objects.</td>
<td>Optional†</td>
</tr>
<tr>
<td>deserializevalue</td>
<td>JSON string</td>
<td>A domain object serialized as specified in clause 15 and encoded using base 64 encoding rules described in RFC 4648 [19], that shall be deserialized to create the new domain object, including all child objects.</td>
<td>Optional†</td>
</tr>
</tbody>
</table>

† Only one of these fields shall be specified in any given operation. Except for value, these fields shall not be stored. If more than one of these fields is supplied, the server shall respond with an HTTP status code of 400 Bad Request.
### 10.5.6 Response headers

The HTTP response headers for creating a domain object using CDMI are shown in Table 85.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>&quot;application/cdmi-domain&quot;</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

### 10.5.7 Response message body

The response message body fields for creating a domain object using CDMI are shown in Table 86.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>JSON string</td>
<td>&quot;application/cdmi-domain&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectID</td>
<td>JSON string</td>
<td>Object ID of the domain</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectName</td>
<td>JSON string</td>
<td>Name of the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parentURI</td>
<td>JSON string</td>
<td>URI for the parent object. Appending the objectName to the parentURI shall always produce a valid URI for the object.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parentID</td>
<td>JSON string</td>
<td>Object ID of the parent container object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>domainURI</td>
<td>JSON string</td>
<td>URI of the owning domain. A domain object is always owned by itself.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>capabilitiesURI</td>
<td>JSON string</td>
<td>URI to the capabilities for the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>metadata</td>
<td>JSON object</td>
<td>Metadata for the domain object. This field includes any user and data system metadata specified in the request body metadata field, along with storage system metadata generated by the cloud storage system. See clause 16 for a further description of metadata.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>childrenrange</td>
<td>JSON string</td>
<td>The sub-domains of the domain expressed as a range. If a range of sub-domains is requested, this field indicates the children returned as a range.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>children</td>
<td>JSON array of JSON strings</td>
<td>Names of the children domains in the domain. Child containers end with &quot;/&quot;.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
### 10.5.8 Response status

Table 87 describes the HTTP status codes that occur when creating a domain object using CDMI.

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201 Created</td>
<td>The new domain object was created.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

### 10.5.9 Examples

**EXAMPLE 1: PUT to the domain URI the domain name and metadata:**

```plaintext
-->
PUT /cdmi/2.0.0/cdmi_domains/MyDomain/ HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-domain
--> Content-Type: application/cdmi-domain
--> "metadata":
-->   "cdmi_domain_enabled": "true"
--> }
<-- HTTP/1.1 201 Created
<-- Content-Type: application/cdmi-domain
<--
<-- "objectType": "application/cdmi-domain",
<-- "objectID": "00007E7F00104BE66AB53A9572F9F51E",
<-- "objectName": "MyDomain/",
<-- "parentURI": "/cdmi_domains/",
<-- "parentID": "00007E7F0010C058374D08B0AC7B3550",
<-- "domainURI": "/cdmi_domains/MyDomain/",
<-- "capabilitiesURI": "/cdmi_capabilities/domain/",
<-- "metadata":
<--   "cdmi_domain_enabled": "true",
<--   "cdmi_authentication_methods": "anonymous, basic",
<-- ...
<-- },
<-- "childrenrange": "0-1",
<-- "children":
<--   "cdmi_domain_summary/",
<--   "cdmi_domain_members/"
<-- ]
<-- }
```
10.6 Read a domain object using CDMI

10.6.1 Synopsis

To read an existing domain object, the following requests shall be performed:

- GET <root URI>/cdmi_domains/<DomainName>/<TheDomainName>/
- GET <root URI>/cdmi_domains/<DomainName>/<TheDomainName>/?<fieldname>&<fieldname>&...
- GET <root URI>/cdmi_domains/<DomainName>/<TheDomainName>/?children=<range>&...
- GET <root URI>/cdmi_domains/<DomainName>/<TheDomainName>/?metadata=<prefix>&...
- GET <root URI>/cdmi_objectid/<DomainObjectID>/
- GET <root URI>/cdmi_objectid/<DomainObjectID>/?<fieldname>&<fieldname>&...
- GET <root URI>/cdmi_objectid/<DomainObjectID>/?children=<range>&...
- GET <root URI>/cdmi_objectid/<DomainObjectID>/?metadata=<prefix>&...

Where:
- <root URI> is the path to the CDMI cloud.
- <DomainName> is zero or more parent domains.
- <TheDomainName> is the name specified for the domain to be read from.
- <fieldname> is the name of a field.
- <range> is a numeric range within the list of children.
- <prefix> is a matching prefix that returns all metadata items that start with the prefix value.
- <DomainObjectID> is the ID of the domain object to be read from.

10.6.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 88.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_read_metadata</td>
<td>Domain object</td>
<td>Ability to read the metadata of an existing domain</td>
</tr>
<tr>
<td>cdmi_list_children</td>
<td>Domain object</td>
<td>Ability to list the children of an existing domain</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

10.6.3 Request headers

The HTTP request headers for reading a CDMI domain object using CDMI are shown in Table 89.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Header</td>
<td>&quot;application/cdmi-domain&quot; or a consistent value as described in 5.5.2</td>
<td>Optional</td>
</tr>
</tbody>
</table>

10.6.4 Request message body

A request body shall not be provided.
10.6.5 Response headers

The HTTP response headers for reading a CDMI domain object using CDMI are shown in Table 90.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>&quot;application/cdmi-domain&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Location</td>
<td>Header string</td>
<td>The server shall respond with an absolute URI to</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>which the reference redirects if the object is a</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>reference is a reference.</td>
<td></td>
</tr>
</tbody>
</table>

10.6.6 Response message body

The response message body fields for reading a CDMI domain object using CDMI are shown in Table 91.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>JSON string</td>
<td>&quot;application/cdmi-domain&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectID</td>
<td>JSON string</td>
<td>Object ID of the domain</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectName</td>
<td>JSON string</td>
<td>Name of the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parentURI</td>
<td>JSON string</td>
<td>URI for the parent object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parentID</td>
<td>JSON string</td>
<td>Object ID of the parent domain object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>domainURI</td>
<td>JSON string</td>
<td>URI of the owning domain. A domain object shall</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td></td>
<td>always be owned by itself.</td>
<td></td>
</tr>
<tr>
<td>capabilitiesURI</td>
<td>JSON string</td>
<td>URI to the capabilities for the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>metadata</td>
<td>JSON object</td>
<td>Metadata for the domain object. This field</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td></td>
<td>includes any user and data system metadata</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>specified in the request body metadata field,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>along with storage system metadata generated by</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the cloud storage system. See clause 16 for a</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>further description of metadata.</td>
<td></td>
</tr>
<tr>
<td>childrenrange</td>
<td>JSON string</td>
<td>The sub-domains of the domain expressed as a</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td></td>
<td>range. If a range of sub-domains is requested,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>this field indicates the children returned as a</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>range.</td>
<td></td>
</tr>
<tr>
<td>children</td>
<td>JSON array of</td>
<td>The children of the domain. Sub-domains end with</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>JSON strings</td>
<td>&quot;/&quot;</td>
<td></td>
</tr>
</tbody>
</table>

If individual fields are specified in the GET request, only these fields are returned in the result body. Optional fields that are requested but do not exist are omitted from the result body.
10.6.7 Response status

Table 92 describes the HTTP status codes that occur when reading a domain object using CDMI.

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 OK</td>
<td>The domain object content was returned in the response.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>406 Not Acceptable</td>
<td>The server is unable to provide the object in the content type specified in the Accept header.</td>
</tr>
</tbody>
</table>

10.6.8 Examples

EXAMPLE 1: GET to the domain URI to read all the fields of the domain:

```plaintext
---> GET /cdmi/2.0.0/cdmi_domains/MyDomain/ HTTP/1.1
---> Host: cloud.example.com
---> Accept: application/cdmi-domain
<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-domain
<-- {
<--   "objectType": "application/cdmi-domain",
<--   "objectID": "00007E7F00104BE66AB53A9572F9F51E",
<--   "objectName": "MyDomain/",
<--   "parentURI": "/cdmi_domains/",
<--   "parentID": "00007E7F0010C058374D08B0AC7B3550",
<--   "domainURI": "/cdmi_domains/MyDomain/",
<--   "capabilitiesURI": "/cdmi_capabilities/domain/",
<--   "metadata": {
<--     "cdmi_domain_enabled": "true",
<--     "cdmi_authentication_methods": "anonymous, basic",
<--     ...
<--   },
<--   "childrenrange": "0-1",
<--   "children": [
<--     "cdmi_domain_summary/",
<--     "cdmi_domain_members/"
<--   ]
<-- }
```

EXAMPLE 2: GET to the domain URI to read the parentURI and children of the domain:

```plaintext
---> GET /cdmi/2.0.0/MyDomain/?parentURI&children HTTP/1.1
---> Host: cloud.example.com
---> Accept: application/cdmi-domain
<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-domain
<-- {
<--   "parentURI": "/cdmi_domains/",
<--   "children": [
<--     "cdmi_domain_summary/",
<--     "cdmi_domain_members/
<--   ]
<-- }
```
EXAMPLE 3: GET to the domain URI to read the first two children of the domain:

```plaintext
--> GET /cdmi/2.0.0/MyDomain/?childrenrange&children=0-1 HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-domain
<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-domain
<--
<-- {
<--   "childrenrange": "0-1",
<--   "children": [
<--     "cdmi_domain_summary/",
<--     "cdmi_domain_members/
<--   ]
<-- }
```
10.7 Update a domain object using CDMI

10.7.1 Synopsis

To update part or all of an existing domain object, the following requests shall be performed:

- PATCH <root URI>/cdmi_domains/<DomainName>/<TheDomainName>/
- PATCH <root URI>/cdmi_domains/<DomainName>/<TheDomainName>?metadata=<metadataname>&
- PATCH <root URI>/cdmi_objectid/<DomainObjectID>
- PATCH <root URI>/cdmi_objectid/<DomainObjectID>?metadata=<metadataname>&

Where:
- <root URI> is the path to the CDMI cloud.
- <DomainName> is zero or more parent domains.
- <TheDomainName> is the name specified for the domain to be read from.
- <DomainObjectID> is the ID of the data object to be read from.

10.7.2 Delayed completion of update

Delayed completion shall not be supported for creating domain objects.

10.7.3 Capabilities

Capabilities that indicate which operations are supported are shown in Table 93.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_modify_metadata</td>
<td>Domain object</td>
<td>Ability to modify the metadata of an existing domain object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

10.7.4 Request headers

The HTTP request headers for updating a CDMI domain object using CDMI are shown in Table 94.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>&quot;application/cdmi-domain&quot;</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
### 10.7.5 Request message body

The request message body fields for updating a domain object using CDMI are shown in Table 95.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata</td>
<td>JSON object</td>
<td>Metadata for the domain object. If present, the new metadata specified replaces the existing object metadata. If individual metadata items are specified in the URI, only those items are replaced; other items are preserved. See clause 16 for a further description of metadata.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
| copy         | JSON string  | URI of a CDMI domain object that shall be copied into the existing domain object. Only the metadata and membership of the domain object itself shall be copied, not any sub-domains of the domain object.  
  - If the destination domain object URI and the copy source domain object URI both do not specify individual fields, the destination domain object metadata and membership shall be replaced with the source domain object metadata and membership.  
  - If the destination domain object URI or the copy source domain object URI specifies individual fields, only the fields specified shall be used to update the destination domain object. If specified fields are not present in the source, these fields shall be ignored.  
  - If the destination domain object URI and the copy source domain object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client.  
If there are insufficient permissions to read the domain object at the source URI or create the domain object at the destination URI, or if the read operation fails, the copy shall return an HTTP status code of 400 Bad Request, and the destination domain object shall not be updated. | Optional² |
| deserialize  | JSON string  | URI of a CDMI data object with a value that contains a domain object serialized as specified in clause 15. The serialized domain object shall be deserialized to update the existing domain object.  
The object ID of the serialized domain object shall match the object ID of the destination domain object. Otherwise, the server shall return an HTTP status code of 400 Bad Request.  
  - If the serialized domain object does not contain sub-domains, the update is applied only to the domain object, and any existing sub-domains are left as is.  
  - If the serialized domain object does contain sub-domains, then creates, updates, and deletes are recursively applied for each sub-domain, depending on the differences between the provided serialized state and the current state of the sub-domains. | Optional² |
Table 95 – continued from previous page

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>deserializevalue</td>
<td>JSON string</td>
<td>A domain object serialized as specified in clause 15 and encoded using base 64 encoding rules described in RFC 4648 [19], that shall be deserialized to update the existing domain object. The object ID of the serialized domain object shall match the object ID of the destination domain object. Otherwise, the server shall return an HTTP status code of 400 Bad Request. • If the serialized domain object does not contain sub-domains, the update is applied only to the domain object, and any existing sub-domains are left as is. • If the serialized domain object does contain sub-domains, then creates, updates, and deletes are recursively applied for each sub-domain, depending on the differences between the provided serialized state and the current state of the sub-domains.</td>
<td>Optional²</td>
</tr>
</tbody>
</table>

10.7.6 Response header

The HTTP response header for updating a CDMI domain object using CDMI is shown in Table 96.

Table 96: Response header - Update a domain object using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>Header string</td>
<td>The server shall respond with an absolute URI to which the reference redirects if the object is a reference.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

10.7.7 Response message body

A response body may be provided as per RFC 2616 [23].

10.7.8 Response status

Table 97 describes the HTTP status codes that occur when updating a domain object using CDMI.

Table 97: HTTP status codes - Update a domain object using CDMI

<table>

</tbody>
</table>

² Only one of these fields shall be specified in any given operation. Except for value, these fields shall not be stored.
10.7.9 Example

EXAMPLE 1: PATCH to the domain URI to set new field values:

```plaintext
--> PATCH /cdmi/2.0.0/cdmi_domains/MyDomain/ HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-domain
--> 
--> {  
-->   "metadata": {  
-->     "test": "value"  
-->   }  
--> }

<-- HTTP/1.1 204 No Content
```
10.8 Delete a domain object using CDMI

10.8.1 Synopsis

To delete an existing domain object, and transfer all objects associated with that domain to another domain (to preserve access), the following request shall be performed:

- DELETE <root URI>/cdmi_domains/<DomainName>/<TheDomainName/>
- DELETE <root URI>/cdmi_objectid/<DomainObjectID>

Where:
- <root URI> is the path to the CDMI cloud.
- <DomainName> is zero or more parent domains.
- <TheDomainName> is the name specified for the domain to be deleted.
- <DomainObjectID> is the ID of the domain object to be deleted.

10.8.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 98.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_delete_domain</td>
<td>Domain object</td>
<td>Ability to delete an existing domain object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

10.8.3 Request headers

Request headers may be provided as per RFC 2616 [23].

10.8.4 Request message body

A request body may be provided as per RFC 2616 [23].

10.8.5 Response headers

Response headers may be provided as per RFC 2616 [23].

10.8.6 Response message body

A response body may be provided as per RFC 2616 [23].
10.8.7 Response status

Table 99 describes the HTTP status codes that occur when deleting a domain object using CDMI.

Table 99: HTTP status codes - Delete a domain object using CDMI

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The domain object was successfully deleted.</td>

10.8.8 Example

EXAMPLE 1: DELETE to the domain object URI:

```
--> DELETE /cdmi/2.0.0/cdmi_domains/MyDomain/ HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```
Queue object resource operations using CDMI

11.1 Overview

Queue objects are similar to data objects, only with first-in, first-out access "queue"-style access semantics when storing and retrieving value data.

If a cloud storage system supports queues, the `cdmi_queues` system-wide capability shall be present. The ability to create a queue object is determined by the presence or absence of the `cdmi_create_queue` and `cdmi_post_queue` capabilities in the parent container, and by the `cdmi_post_queue_by_ID` system-wide capability for creation by ID.

A queue object writer POSTs data into a queue object, and a queue object reader GETs value(s) from the queue object and subsequently deletes the value(s) to acknowledge receipt of the value(s) that it received. Queues provide a simple mechanism for one or more writers to send data to a single reader in a reliable way. If supported by the cloud storage system, cloud clients create the queue objects by using the mechanism described in 9.8 and this clause.

Each CDMI queue object is represented as a JSON object, containing one or more "fields". For example, the "metadata" field contains metadata items.

```
EXAMPLE 1: CDMI queue object
{
   "objectType": "application/cdmi-queue",
   "objectID": "00007E7F00104BE66AB53A9572F9F51E",
   "objectName": "MyQueue",
   "parentURI": "/MyContainer/",
   "parentID": "00007ED900104F67307652BAC9A37C93",
   "domainURI": "/cdmi_domains/MyDomain/",
   "capabilitiesURI": "/cdmi_capabilities/queue/",
   "completionStatus": "Complete",
   "metadata": {},
   "queueValues": "1-1",
   "mimetype": ["text/plain"],
   "valuerange": ["0-19"],
   "valuetransferencoding": ["utf-8"],
   "value": ["First Enqueued Value"]
}
```

The meaning, use, and permitted values of each field are described in each operation that creates, modifies or retrieves CDMI queue objects.
11.2 Queue object details

11.2.1 Queue object addressing

Queue objects are addressed in CDMI in two ways:

- by name (e.g., https://cloud.example.com/cdmi/2.0.0/queueobject); and
- by ID (e.g., https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/
  → 00007ED900104F67307652BAC9A37C93/).

Every queue object has a single, globally-unique object ID that remains constant for the life of the object. Each queue object may also have one or more URI addresses that allow the queue object to be accessed.

11.2.2 Queue object fields

Individual fields within a queue object can be accessed by specifying the field name after a question mark “?” appended to the end of the queue object URI.

**EXAMPLE 2:** The following URI returns just the number of values stored in the queue object in the response body:

https://cloud.example.com/cdmi/2.0.0/queueobject?queueValues

A list of unique fields, separated by an ampersand “&” can be specified, allowing multiple fields to be accessed in a single request.

**EXAMPLE 3:** The following URI returns the number of values stored and metadata fields in the response body:

https://cloud.example.com/cdmi/2.0.0/queueobject?queueValues&metadata

When a client provides fields that are not defined in this International Standard or deserializes an object containing fields that are not defined in this International Standard, these fields shall be persisted, but shall not be interpreted.

11.2.3 Queue object value

The encoding of the data stored in the queue object value field depends on the queue object valuetransferencoding field:

- If the value transfer encoding of the object is set to “utf-8”, the data stored in the value of the queue object shall be a valid UTF-8 string, and it shall be transported as a UTF-8 string in the value field.
- If the value transfer encoding of the object is set to “base64”, the data stored in the value of the queue object may contain arbitrary binary sequences, and it shall be transported as a base 64-encoded string in the value field.
- If the value transfer encoding of the object is set to “json”, the data stored in the value of the queue object shall be a valid JSON object, and the value field shall contain a valid JSON object.

Specific ranges of the value of a queue object can be accessed by specifying a byte range after the value field name.

**EXAMPLE 4:** The following URI returns the first thousand bytes of the oldest value enqueued:

https://cloud.example.com/cdmi/2.0.0/queueobject?value=0-999

Because a byte range of a UTF-8 string is often not a valid UTF-8 string, the response to a range request shall always be transported in the value field as a base 64-encoded string.

Byte ranges are specified as single, inclusive byte ranges as per Section 14.35.1 of RFC 2616 [23].

If read access to any of the requested fields is not permitted by the object ACL, only the permitted fields shall be returned. If no requested fields are permitted to be read, an HTTP status code of 403 Forbidden shall be returned to the client.

If write access to any of the requested fields is not permitted by the object ACL, no updates shall be performed, and an HTTP status code of 403 Forbidden shall be returned to the client.

When a client provides or includes deserialization fields that are not defined in this International Standard, these fields shall be stored as part of the object.

The value of a queue object may also be specified and retrieved using multi-part MIME, where the CDMI JSON is transferred in the first MIME part and the raw queue values are transferred in the subsequent MIME parts. Each MIME
part, including any header fields, shall conform to RFC 2045 [9], RFC 2046 [10], and RFC 2616 [23], and the length of each part may optionally be specified by a "Content-Length" header in addition to the MIME boundary delimiter.

Multiple non-overlapping ranges of the value of a queue object may also be accessed or updated in a multi-part MIME operation by transferring one MIME part for each range of the value. The byte ranges for these operations shall be specified as per Section 14.35.1 of RFC 2616 [23].

Multi-part MIME enables the efficient transfer of binary data alongside CDMI object metadata without incurring the overhead of the UTF-8 or Base64 encoding and validation required to represent binary data in JSON.

11.2.4 Queue object metadata

Queue object metadata may also include arbitrary user-supplied metadata, storage system metadata, and data system metadata, as specified in clause 16. Metadata shall be stored as a valid UTF-8 string. Binary data stored in user metadata shall be first encoded such that it can be contained in a UTF-8 string, with the use of base 64 encoding recommended.

Every queue object has a parent object from which the queue object inherits data system metadata that is not explicitly specified in the data object itself.

EXAMPLE 5: The "pages" queue object stored at the following URI would inherit data system metadata from its parent container, "OCR":

https://cloud.example.com/cdmi/2.0.0/OCR/pages

11.2.5 Queue object access control

If read access to any of the requested fields is not permitted by the object ACL, only the permitted fields shall be returned.

If no requested fields are permitted to be read, an HTTP status code of 403 Forbidden shall be returned to the client.

If write access to any of the requested fields is not permitted by the object ACL, no updates shall be performed, and an HTTP status code of 403 Forbidden shall be returned to the client.

11.2.6 Queue object consistency

Writing to a queue object is an atomic operation.

For non-value-related fields:

• If a client reads a queue object simultaneously with a write to that same queue object, the reading client shall get either the old version or the new version, but not a mixture of both.

• If a write is terminated due to errors, the contents of the queue object shall be as if the write never occurred (i.e., writes are atomic in the face of errors).

For value-related fields:

• If a client dequeues or deletes one or more queue values simultaneously with one or more queue values being enqueued to that same queue object, the order of operations shall be as if the dequeue/delete operation happens before the enqueue operation.

• If a dequeue, delete or enqueue is terminated due to errors, the contents of the queue object shall be as if the dequeue/delete/enqueue never occurred (i.e., writes are atomic in the face of errors).

Create and update timestamps that are returned in response to multiple client writes to a given object may indicate that a specific write is the newest (i.e., the write whose data is expected to be returned to subsequent reads until another write is processed). However, there is no guarantee that the write with the latest timestamp is the one whose data is returned on subsequent reads.

Implementations of this International Standard shall provide the atomicity features described in this subclause for queue objects that are accessed via CDMI. The atomicity properties of queue objects that are accessed by protocols other than CDMI are outside the scope of this International Standard.
11.2.7 Queue object representations

The representations in this clause are shown using JSON notation. Both clients and servers shall support UTF-8 JSON representation. The request and response body JSON fields may be specified or returned in any order, with the exception that, if present, for queue objects, the "valuerange" and "value" fields shall appear last and in that order.
11.3 Create a queue object using CDMI

11.3.1 Synopsis

To create a new queue object, the following request shall be performed:

- PUT <root URI>/<ContainerName>/<QueueName>

To create a new queue object by ID, see 9.8.

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers that already exist, with one slash (i.e., "/") between each pair of container names.
- <QueueName> is the name specified for the queue object to be created.

After it is created, the object shall also be accessible at <root URI>/cdmi_objectid/<objectID>.

The newly created queue shall have no values unless the queue is created as a result of copying or moving a source queue that has values or as a result of deserializing a serialized queue that has values.

11.3.2 Delayed completion of create

In response to a create operation for a queue object, the server may return an HTTP status code of 202 Accepted to indicate that the object is in the process of being created. This response is useful for long-running operations (e.g., copying a large queue object from a source URI). Such a response has the following implications.

- The server shall return a "Location" header with an absolute URI to the object to be created along with an HTTP status code of 202 Accepted.
- With an HTTP status code of 202 Accepted, the server implies that the following checks have passed:
  - user authorization for creating the object;
  - user authorization for read access to any source object for move, copy, serialize, or deserialize; and
  - availability of space to create the object or at least enough space to create a URI to report an error.
- A client might not be able to immediately access the created object, e.g., due to delays resulting from the implementation’s use of eventual consistency.

The client performs GET operations to the URI to track the progress of the operation. In response, the server returns two fields in its response body to indicate progress.

- A mandatory completionStatus text field contains either "Processing", "Complete", or an error string starting with the value "Error".
- An optional percentComplete field contains the percentage of the operation that has completed (0 to 100).

GET shall not return any value for the queue object when completionStatus is not "Complete". If the final result of the create operation is an error, the URI is created with the completionStatus field set to the error message. It is the client’s responsibility to delete the URI after the error has been noted.

11.3.3 Capabilities

Capabilities that indicate which operations are supported are shown in Table 100.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_create_queue</td>
<td>Parent container</td>
<td>Ability to create a new queue object</td>

</tr>
</thead>
<tbody>
<tr>
<td>cdmi_move_queue</td>
<td>Parent container</td>
<td>Ability to move a queue object from another queue object</td>
</tr>
<tr>
<td>cdmi_deserialize_queue</td>
<td>Parent container</td>
<td>Ability to create a queue object that is deserialized from the contents of the PUT or the contents of another data object</td>
</tr>
</tbody>
</table>

### 11.3.4 Request headers

The HTTP request headers for creating a CDMI queue object using CDMI are shown in Table 101.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Header</td>
<td>&quot;application/cdmi-queue&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>&quot;application/cdmi-queue&quot;</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

### 11.3.5 Request message body

The request message body fields for creating a queue object using CDMI are shown in Table 102.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| metadata    | JSON object | Metadata for the queue object      
|             |         | - If this field is included, the contents of the JSON object provided in this field shall be used as queue object metadata.  
|             |         | - If this field is included when deserializing, serializing, copying, or moving a queue object, the contents of the JSON object provided in this field shall be used as object metadata instead of the metadata from the source URI.  
|             |         | - If this field is not included, no user-specified metadata shall be added to the object.  
|             |         | - If this field is not included when deserializing, serializing, copying, or moving a queue object, metadata from the source URI shall be used.  
|             |         | - This field shall not be included when creating a reference to a queue object.  | Optional    |
| domainURI   | JSON string | URI of the owning domain  
|             |         | - If different from the parent domain, the user shall have the "cross_domain" privilege (see cdmi_member_privileges in Table 80).  
|             |         | - If not specified, the domain of the parent container shall be used.  | Optional    |
| deserialize  | JSON string | URI of a CDMI data object with a value that contains a queue object serialized as specified in clause 15. The serialized queue object shall be deserialized to create the new queue object.  | Optional¹  |

Continued on next page
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| copy        | JSON string | URI of a source CDMI queue object that shall be copied into the new destination queue object.  
• If the destination queue object URI and the copy source queue object URI both do not specify individual fields, the destination queue object shall be a complete copy of the source queue object, including all enqueued values.  
• If the destination queue object URI or the copy source queue object URI specifies individual fields, only the fields specified shall be used to create the destination queue object. If specified fields are not present in the source, default field values shall be used.  
• If the destination queue object URI and the copy source queue object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client.  
If there are insufficient permissions to read the queue object at the source URI or create the queue object at the destination URI, or if the read operation fails, the copy shall return an HTTP status code of 400 Bad Request, and the destination queue object shall not be created. |
| move        | JSON string | URI of an existing local or remote CDMI queue object (source URI) that shall be relocated to the URI specified in the PUT.  
The contents of the queue object, including the object ID, shall be preserved by a move, and the queue object at the source URI shall be removed after the queue object at the destination has been successfully created.  
If there are insufficient permissions to read the queue object at the source URI, write the queue object at the destination URI, or delete the queue object at the source URI, or if any of these operations fail, the move shall return an HTTP status code of 400 Bad Request, and the source and destination are left unchanged. |
| reference   | JSON string | URI of a CDMI queue object that shall be redirected to by a reference. If other fields are supplied when creating a reference, the server shall respond with an HTTP status code of 400 Bad Request. |
| deserializevalue | JSON string | A queue object serialized as specified in clause 15 and encoded using base 64 encoding rules described in RFC 4648 [19], that shall be deserialized to create the new queue object. |

1 Only one of these fields shall be specified in any given operation. Except for value, these fields shall not be stored. If more than one of these fields is supplied, the server shall respond with an HTTP status code of 400 Bad Request.
### 11.3.6 Response status

The HTTP response headers for creating a CDMI queue object using CDMI are shown in Table 103.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>&quot;application/cdmi-queue&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Location</td>
<td>Header</td>
<td>When an HTTP status code of 202 Accepted is returned, the server shall respond with the absolute URL of the object that is in the process of being created.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

### 11.3.7 Response message body

The response message body fields for creating a CDMI queue object using CDMI are shown in Table 104.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>JSON string</td>
<td>&quot;application/cdmi-queue&quot;</td>

<tr>
<td>capabilitiesURI</td>
<td>JSON string</td>
<td>URI to the capabilities for the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>completionStatus</td>
<td>JSON string</td>
<td>A string indicating if the object is still in the process of being created or updated by another operation, and after that operation is complete, indicates if it was successfully created or updated or if an error occurred. The value shall be the string &quot;Processing&quot;, the string &quot;Complete&quot;, or an error string starting with the value &quot;Error&quot;.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
| percentComplete  | JSON string | A string indicating the percentage of completion if the object is still in the process of being created or updated by another operation.  
  - When the value of completionStatus is "Processing", this field, if provided, shall indicate the percentage of completion as a numeric integer value from "0" through "100".  
  - When the value of completionStatus is "Complete", this field, if provided, shall contain the value "100".  
  - When the value of completionStatus is "Error", this field, if provided, may contain any integer value from "0" through "100". | Optional    |

Continued on next page
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata</td>
<td>JSON object</td>
<td>Metadata for the queue object. This field includes any user and data system metadata specified in the request body metadata field, along with storage system metadata generated by the cloud storage system. See clause 16 for a further description of metadata.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>queueValues</td>
<td>JSON string</td>
<td>The range of designators for enqueued values. Every enqueued value shall be assigned a unique, monotonically-incrementing positive integer designator, starting from 0. If no values are enqueued, an empty string shall be returned. If values are enqueued, the lowest designator, followed by a hyphen (&quot;-&quot;), followed by the highest designator shall be returned.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

### 11.3.8 Response status

The HTTP status codes that occur when creating a queue object using CDMI are described in Table 105.

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201 Created</td>
<td>The new queue object was created.</td>
</tr>
<tr>
<td>202 Accepted</td>
<td>The queue object is in the process of being created. The CDMI client should monitor the completionStatus and percentComplete fields to determine the current status of the operation.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

### 11.3.9 Examples

Example 1: PUT to the queue URI the queue object name and contents:

```
  --> PUT /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
  --> Host: cloud.example.com
  --> Accept: application/cdmi-queue
  --> Content-Type: application/cdmi-queue
  -->
  -->   "metadata": {
  -->     }
  -->
  HTTP/1.1 201 Created
  Content-Type: application/cdmi-queue
  
  "objectType": "application/cdmi-queue",
  "objectID": "00007E7F00104BE66AB53A9572F9F51E",
  "objectName": "MyQueue",
  "parentURI": "/MyContainer/",
  "parentID": "00007E900104E67307652BAC9A37C93",
  "domainURI": "/cdmi_domains/MyDomain/",
  "capabilitiesURI": "/cdmi_capabilities/queue/",
  "completionStatus": "Complete",
```

(continues on next page)
EXAMPLE 2: PUT to the queue object URI to create a new queue, copying from another queue:

```plaintext
--> PUT /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-queue
 --> {
  -->  "copy": "/MyContainer/SourceQueue?value=0-9"
 --> }

<-- HTTP/1.1 201 Created
<-- Content-Type: application/cdmi-queue
<-- {
  <-- "objectType": "application/cdmi-queue",
  <-- "objectID": "00007E7F00104BE66AB53A9572F9F51E",
  <-- "objectName": "MyQueue",
  <-- "parentURI": "/MyContainer/",
  <-- "parentID": "00007ED900104F67307652BAC9A37C93",
  <-- "domainURI": "/cdmi_domains/MyDomain/",
  <-- "capabilitiesURI": "/cdmi_capabilities/queue/",
  <-- "completionStatus": "Complete",
  <-- "metadata": {
    <-- ...
  <-- },
  <-- "queueValues": "0-9"
 <-- }
```
11.4 Read a queue object using CDMI

11.4.1 Synopsis

To read all fields from an existing queue object, the following request shall be performed:

- GET <root URI>/<ContainerName>/<QueueName>
- GET <root URI>/<ContainerName>/<QueueName>?<fieldname>&<fieldname>&...
- GET <root URI>/<ContainerName>/<QueueName>?value=<range>&...
- GET <root URI>/<ContainerName>/<QueueName>?metadata=<prefix>&...
- GET <root URI>/<ContainerName>/<QueueName>?values=<count>
- GET <root URI>/cdmi_objectid/<QueueObjectID>
- GET <root URI>/cdmi_objectid/<QueueObjectID>?<fieldname>&<fieldname>&...
- GET <root URI>/cdmi_objectid/<QueueObjectID>?value=<range>&...
- GET <root URI>/cdmi_objectid/<QueueObjectID>?metadata=<prefix>&...
- GET <root URI>/cdmi_objectid/<QueueObjectID>?values=<count>

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers.
- <QueueName> is the name of the queue object to be read from.
- <fieldname> is the name of a field.
- <range> is a byte range of the queue object value to be returned in the value field. If a byte range is requested, the range returned shall be from the oldest queue object value.
- <prefix> is a matching prefix that returns all metadata items that start with the prefix value.
- <count> is the number of values to be retrieved from the queue object. If more queue object entries are requested to be retrieved than exist in the queue object, the count is processed as if it is equal to the number of entries in the queue object.
- <QueueObjectID> is the ID of the queue object to be read from.

Reading a queue object shall, by default, return the complete value of the oldest item in the queue, unless the queue-Values range is empty.

11.4.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 106.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Ability to read a queue object using multi-part MIME</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>
### 11.4.3 Request headers

The HTTP request headers for reading a CDMI queue object using CDMI are shown in Table 107.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Header</td>
<td>&quot;application/cdmi-queue&quot;, &quot;multipart/mixed&quot;, or a consistent value as defined in 5.5.2.</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>string</td>
<td>If &quot;multipart/mixed&quot;, the body shall consist of one or more MIME parts, where the first part shall contain a body of content-type &quot;application/cdmi-queue&quot;, and the second and subsequent parts shall each contain the corresponding queue value.</td>
<td></td>
</tr>
</tbody>
</table>

### 11.4.4 Request message body

A request body shall not be provided.

### 11.4.5 Response status

The HTTP response headers for reading a CDMI queue object using CDMI are shown in Table 108.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>&quot;application/cdmi-queue&quot; or &quot;multipart/mixed&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Location</td>
<td>Header</td>
<td>The server shall respond with an absolute URI to which the reference redirects if the object is a reference.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

### 11.4.6 Response message body

The response message body fields for reading a CDMI queue object using CDMI are shown in Table 109.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>JSON string</td>
<td>&quot;application/cdmi-queue&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectID</td>
<td>JSON string</td>
<td>Object ID of the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectName</td>
<td>JSON string</td>
<td>Name of the object</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For objects in a container, the objectName field shall be returned.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For objects not in a container (objects that are only accessible by ID), the &quot;objectName&quot; field does not exist and shall not be returned.</td>
<td></td>
</tr>
</tbody>
</table>

Continued on next page
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| parentURI   | JSON string | URI for the parent object  
• For objects in a container, the parentURI field shall be returned.  
• For objects not in a container (objects that are only accessible by ID), the "parentURI" field does not exist and shall not be returned.  
Appending the "objectName" to the "parentURI" shall always produce a valid URI for the object. | Conditional |
| parentID    | JSON string | Object ID of the parent container object  
• For objects in a container, the "parentID" field shall be returned.  
• For objects not in a container (objects that are only accessible by ID), the "parentID" field does not exist and shall not be returned. | Conditional |
| domainURI   | JSON string | URI of the owning domain                                                    | Mandatory   |
| capabilitiesURI | JSON string | URI to the capabilities for the object                                      | Mandatory   |
| completionStatus | JSON string | A string indicating if the object is still in the process of being created or updated by another operation, and after that operation is complete, indicates if it was successfully created or updated or if an error occurred.  
The value shall be the string "Processing", the string "Complete", or an error string starting with the value "Error". | Mandatory |
| percentComplete | JSON string | A string indicating the percentage of completion if the object is still in the process of being created or updated by another operation.  
• When the value of completionStatus is "Processing", this field, if provided, shall indicate the percentage of completion as a numeric integer value from 0 through 100.  
• When the value of completionStatus is "Complete", this field, if provided, shall contain the value "100".  
• When the value of completionStatus is "Error", this field, if provided, may contain any integer value from "0" through "100". | Optional |
| metadata    | JSON object | Metadata for the queue object. This field includes any user and data system metadata specified in the request body metadata field, along with storage system metadata generated by the cloud storage system.  
See clause 16 for a further description of metadata. | Mandatory |
| queueValues | JSON string | The range of designators for enqueued values. Every enqueued value shall be assigned a unique, monotonically-incrementing positive integer designator, starting from 0. If no values are enqueued, an empty string shall be returned. If values are enqueued, the lowest designator, followed by a hyphen ("-") followed by the highest designator shall be returned.  
• This field shall only be provided when completionStatus is "Complete" and when one or more values are enqueued. | Mandatory |
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>mimetype</td>
<td>JSON array of JSON strings</td>
<td>MIME types for each queue object value * The MIME types of the values are returned, each corresponding to the value in the same position in the JSON array. * This field shall only be provided when completionStatus is &quot;Complete&quot; and when one or more values are enqueued.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
| valuerange              | JSON array of JSON strings | The range of bytes of the queue object values to be returned in the value field  
  • The value ranges of the values are returned, each corresponding to the value in the same position in the JSON array.  
  • If a specific value range has been requested, the entry in the valuerange field shall correspond to the bytes requested. If the request extends beyond the end of the value, the valuerange field shall indicate the smaller byte range returned.  
  • This field shall only be provided when completionStatus is "Complete" and when one or more values are enqueued.                                                                 | Optional     |
| valuetransfer encoding  | JSON array of JSON strings | The value transfer encoding used for each queue object value. Two value transfer encodings are defined:  
  • "utf-8" indicates that the queue object value contains a valid UTF-8 string, and it shall be transported as a UTF-8 string in the value field.  
  • "base64" indicates that the queue object value may contain arbitrary binary sequences, and it shall be transported as a base 64-encoded string in the value field.  
  • "json" indicates that the queue object value contains a valid JSON object, and the value field shall contain a JSON object.  
  The value transfer encodings are returned, each corresponding to the value in the same position in the JSON array.  
  • This field shall only be provided when completionStatus is "Complete" and when one or more values are enqueued.                                                                 | Optional     |
| value                   | JSON array of JSON strings | The oldest enqueued queue object values  
  • The values in the JSON array are returned in order from oldest to newest.  
  • If the valuetransferencoding field indicates UTF-8 encoding, the corresponding value field shall contain a UTF-8 string using JSON escaping rules described in RFC 4627 [5].  
  • If the valuetransferencoding field indicates base 64 encoding, the corresponding value field shall contain a base 64-encoded string as described in RFC RFC 4648 [19].  
  • If the valuetransferencoding field indicates JSON encoding, the corresponding value field shall contain a JSON object.  
  • The value field shall not be provided when using multi-part MIME.  
  • The value field shall only be provided when the completionStatus field contains "Complete".                                                                 | Conditional  |

If individual fields are specified in the GET request, only these fields are returned in the result body. Optional fields that are requested but do not exist are omitted from the result body.
11.4.7 Response status

The HTTP status codes that occur when reading a queue object using CDMI are described in Table 110.

Table 110: HTTP status codes - Read a queue object using CDMI

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 OK</td>
<td>The queue object content was returned in the response.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>406 Not Acceptable</td>
<td>The server is unable to provide the object in the content type specified in the Accept header.</td>
</tr>
</tbody>
</table>

11.4.8 Examples

**EXAMPLE 1: GET to the queue object URI to read all fields of the queue object:**

```
--> GET /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-queue

<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-queue
<--
<-- {
<--   "objectType": "application/cdmi-queue",
<--   "objectID": "00007E7F00104BE66AB53A9572F9F51E",
<--   "objectName": "MyQueue",
<--   "parentURI": "/MyContainer/",
<--   "parentID": "00007ED900104F67307652BAC9A37C93",
<--   "domainURI": "/cdmi_domains/MyDomain/",
<--   "capabilitiesURI": "/cdmi_capabilities/queue/",
<--   "completionStatus": "Complete",
<--   "metadata": {},
<--   "queueValues": "1-1",
<--   "mimetype": [
<--     "text/plain"
<--   ],
<--   "valuerange": [
<--     "0-19"
<--   ],
<--   "valueTransferEncoding": [
<--     "utf-8"
<--   ],
<--   "value": [
<--     "First Enqueued Value"
<--   ]
<-- }
```

**EXAMPLE 2: GET to the queue object URI to read the value and queue items of the queue object:**

```
--> GET /cdmi/2.0.0/MyContainer/MyQueue?value&queueValues HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-queue

<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-queue
<--
<-- {
<--   "queueValues": "1-1",
<--   "value": [
<--     "First Enqueued Value"
<--   ]
<-- }
```

(continues on next page)
EXAMPLE 3: GET to the queue object URI to read the first five bytes of the value of the queue object:

```plaintext
---> GET /cdmi/2.0.0/MyContainer/MyQueue?value:0-4 HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-queue
<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-queue
<--
<--    "value" : ["First"
<--        ]
<--
```

EXAMPLE 4: GET to the queue object URI to read two values of the queue object:

```plaintext
---> GET /cdmi/2.0.0/MyContainer/MyQueue?mimetype&valuerange&values=2 HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-queue
<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-queue
<--
<--    "mimetype" : ["text/plain","text/plain"
<--        ],
<--    "valuerange" : [
<--        "0-19",
<--        "0-20"
<--        ],
<--    "value" : [
<--        "First Enqueued Value",
<--        "Second Enqueued Value"
<--        ]
<--
```

EXAMPLE 5: GET to the queue object URI to read the queue object using multi-part MIME:

```plaintext
---> GET /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Accept: multipart/mixed
<-- HTTP/1.1 200 OK
<-- Content-Type: multipart/mixed; boundary=gc0p4Jq0M2Yt08j34c0p
<--
<--    gc0p4Jq0M2Yt08j34c0p
<-- Content-Type: application/cdmi-queue
<--
<--    "objectType": "application/cdmi-queue",
<--    "objectID": "00007ED9001035E14BD1BA70C2EE98FC",
<--    "objectName": "MyQueue",
<--    "parentURI": "/MyContainer/",
<--    "parentID": "00007ED90010C2414303B5C654F83170",
<--    "domainURI": "/cdmi_domains/MyDomain/",
<--    "capabilitiesURI": "/cdmi_capabilities/queue/",
<--    "completionStatus": "Complete",
<--    "metadata": {
<--        ...
<--    },
<--    "queueValues": "1-2",
```

(continues on next page)
11.5 Update a queue object using CDMI

11.5.1 Synopsis

To update some or all fields in an existing queue object (excluding the enqueueing of values), the following request shall be performed:

- PATCH <root URI>/<ContainerName>/<QueueName>
- PATCH <root URI>/<ContainerName>/<QueueName>?metadata=<metadataname>&...
- PATCH <root URI>/cdmi_objectid/<QueueObjectID>
- PATCH <root URI>/cdmi_objectid/<QueueObjectID>?metadata=<metadataname>&...

Where:
- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers.
- <QueueName> is the name of the queue object to be updated.
- <QueueObjectID> is the ID of the queue object to be updated.

11.5.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 111.

Table 111: Capabilities - Update a queue object using CDMI

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_modify_metadata</td>
<td>Queue object</td>
<td>Ability to modify the metadata of an existing queue object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

11.5.3 Request headers

The HTTP request headers for updating a CDMI queue object using CDMI are shown in Table 112.

Table 112: Request headers - Update a queue object Using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>“application/cdmi-queue”</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

11.5.4 Request message body

The request message body fields for updating a queue object using CDMI are shown in Table 113.

Table 113: Request message body - Update a queue object Using CDMI

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata</td>
<td>JSON object</td>
<td>Metadata for the queue object. If present, the new metadata specified replaces the existing object metadata. If individual metadata items are specified in the URI, only those items are replaced; other items are preserved. See clause 16 for a further description of metadata.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
## Table 113 – continued from previous page

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainURI</td>
<td>JSON string</td>
<td>URI of the owning domain&lt;br&gt;• If different from the parent domain, the user shall have the &quot;cross-domain&quot; privilege (see <code>cdmi_member_privileges</code> in Table 80).&lt;br&gt;• If not specified, the existing domain shall be preserved.</td>
<td>Optional</td>
</tr>
<tr>
<td>deserialize</td>
<td>JSON string</td>
<td>URI of a CDMI data object with a value that contains a queue object serialized as specified in clause 15. The serialized queue object shall be deserialized to update the existing queue object.&lt;br&gt;• If the destination queue object URI and the source serialized queue object URI both do not specify individual fields, the destination queue object shall be replaced with the contents of the serialized source queue object, with the exception that the destination queue values shall be preserved. See 11.7 to deserialize enqueued items.&lt;br&gt;• If the destination queue object URI or the source serialized queue object URI specifies individual fields, only the fields specified shall be used to update the destination queue object. If specified fields are not present in the source, these fields shall be ignored. If the value field is specified, it shall be ignored.&lt;br&gt;• If the destination queue object URI and the source serialized queue object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client. If there are insufficient permissions to read the serialized queue object at the source URI or update the queue object at the destination URI, or if the read operation fails, the update shall return an HTTP status code of 400 Bad Request, and the destination queue object shall not be updated.</td>
<td>Optional²</td>
</tr>
<tr>
<td>copy</td>
<td>JSON string</td>
<td>URI of a source CDMI queue object that shall be copied into the existing destination queue object.&lt;br&gt;• If the destination queue object URI and the copy source queue object URI both do not specify individual fields, the destination queue object shall be replaced with the source queue object, with the exception that the destination queue values shall be preserved. See 11.7 to copy enqueued items.&lt;br&gt;• If the destination queue object URI or the copy source queue object URI specifies individual fields, only the fields specified shall be used to update the destination queue object. If specified fields are not present in the source, these fields shall be ignored. If the value field is specified, it shall be ignored.&lt;br&gt;• If the destination queue object URI and the copy source queue object URI both specify fields, an HTTP status code of 400 Bad Request shall be returned to the client. If there are insufficient permissions to read the queue object at the source URI or update the queue object at the destination URI, or if the read operation fails, the update shall return an HTTP status code of 400 Bad Request, and the destination queue object shall not be updated.</td>
<td>Optional²</td>
</tr>
</tbody>
</table>

*Continued on next page*
### Table 113 – continued from previous page

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>deserializevalue</td>
<td>JSON</td>
<td>A queue object serialized as specified in clause 15 and encoded using base 64 encoding rules described in RFC 4648 [19], that shall be deserialized to update the existing queue object. The object ID of the serialized queue object shall match the object ID of the destination queue object. Otherwise, the server shall return an HTTP status code of 400 Bad Request. • If the destination queue object URI does not specify individual fields, the destination queue object shall be replaced with the contents of the serialized source queue object, with the exception that the destination queue values shall be preserved. See 11.7 to serialize enqueued items. • If the destination queue object URI specifies individual fields, only the fields specified shall be used to update the destination queue object. If specified fields are not present in the source, these fields shall be ignored. If the value field is specified, it shall be ignored. If there are insufficient permissions update the queue object at the destination URI, the update shall return an HTTP status code of 400 Bad Request, and the destination queue object shall not be updated.</td>
<td>Optional²</td>
</tr>
</tbody>
</table>

### 11.5.5 Response header

The HTTP response header for updating a CDMI queue object using CDMI is shown in Table 114.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>Header</td>
<td>The server shall respond with an absolute URI to which the reference redirects if the object is a reference.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

### 11.5.6 Response message body

A response body can be provided as per RFC 2616 [23].

### 11.5.7 Response status

Table 115 describes the HTTP status codes that occur when updating a queue object using CDMI.

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The data object content was returned in the response.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

² Only one of these fields shall be specified in any given operation. Except for value, these fields shall not be stored.
11.5.8 Examples

EXAMPLE 1: PATCH to the queue object URI to set new metadata:

```
--> PATCH /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-queue
--> 
--> "metadata": { 
--> } 

<-- HTTP/1.1 204 No Content
```

EXAMPLE 2: PATCH to the queue object URI to move six queue values from another queue:

```
--> PATCH /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-queue
--> 
--> "move": "/MyContainer/SourceQueue?value:10-15"

<-- HTTP/1.1 204 No Content
```
11.6 Delete a queue object using CDMI

11.6.1 Synopsis

To delete an existing queue object, along with all enqueued values, the following request shall be performed:

- DELETE <root URI>/<ContainerName>/<QueueName>
- DELETE <root URI>/cdmi_objectid/<QueueObjectID>

Where:
- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers.
- <QueueName> is the name of the queue object to be deleted.
- <QueueObjectID> is the ID of the queue object to be deleted.

11.6.2 Capability

Capabilities that indicate which operations are supported are shown in Table 116.

Table 116: Capabilities - Delete a queue object using CDMI

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_delete_queue</td>
<td>Queue object</td>
<td>Ability to delete an existing queue object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

11.6.3 Request header

Request headers can be provided as per RFC 2616 [23].

11.6.4 Request message body

A request body can be provided as per RFC 2616 [23].

11.6.5 Response headers

Response headers can be provided as per RFC 2616 [23].

11.6.6 Response message body

A response body can be provided as per RFC 2616 [23].
11.6.7 Response status

Table 117 describes the HTTP status codes that occur when deleting a queue object using CDMI.

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The queue object was successfully deleted.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

11.6.8 Example

EXAMPLE 1: DELETE to the queue object URI:

```bash
--> DELETE /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```
11.7 Enqueue a new queue object value using CDMI

11.7.1 Synopsis

To enqueue one or more values into an existing queue object, the following request shall be performed:

- POST <root URI>/<ContainerName>/<QueueName>
- POST <root URI>/cdmi_objectid/<QueueObjectID>

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers that already exist, with one slash (i.e., “/”) between each pair of container names.
- <QueueName> is the name of the queue object to be enqueued into.
- <QueueObjectID> is the ID of the queue object to be enqueued into.

11.7.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 118.

Table 118: Capabilities - Enqueue a new queue object value using CDMI

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_modify_value</td>
<td>Queue object</td>
<td>Ability to enqueue a value into an existing queue object</td>
</tr>
<tr>
<td>cdmi_multipart_mime</td>
<td>System wide capability</td>
<td>Ability to modify a queue object using multi-part MIME</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

11.7.3 Request headers

The HTTP request headers for enqueuing a new CDMI queue object value using CDMI are shown in Table 119.

Table 119: Request headers - Enqueue a new queue object value using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>&quot;application/cdmi-queue&quot; or &quot;multipart/mixed&quot; If &quot;multipart/mixed&quot;, the first part shall contain a body of content-type &quot;application/cdmi-queue&quot;, and the subsequent parts shall contain the queue values as described in 8.4.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
11.7.4 Request message body

The request message body fields for enqueuing a new queue object value using CDMI are shown in Table 120.

Table 120: Request message body - Enqueue a new queue object value using CDMI

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>mimetype</td>
<td>JSON array of JSON strings</td>
<td>MIME type(s) of the data value(s) to be enqueued into the queue object.</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If this field is not included and multi-part MIME is not being used, the value of &quot;text/plain&quot; shall be assigned as the field value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>

</table>

11.7.8 Examples
EXAMPLE 1: POST to the queue object URI a new value:

```
--> POST /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-queue
-->
--> {  
-->   "mimetype": [  
-->     "text/plain"  
-->   ],  
-->   "value": [  
-->     "Value to Enqueue"  
-->   ]  
--> }

<-- HTTP/1.1 204 No Content
```

EXAMPLE 2: POST to the queue object URI to copy an existing value:

```
--> POST /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
-->
--> {  
-->   "copy": "/MyContainer/MyDataObject.txt"  
--> }

<-- HTTP/1.1 204 No Content
```
EXAMPLE 3: POST to the queue object URI to transfer 20 values from another queue object:

```
--> POST /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> 
--> { 
-->   "move" : "/MyContainer/FirstQueue?values=20"
--> }
<-- HTTP/1.1 204 No Content
```

EXAMPLE 4: POST to the queue object URI two new values:

```
--> POST /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> 
--> { 
-->   "mimetype" : [ 
-->     "text/plain",
-->     "text/plain"
-->   ],
-->   "value" : [ 
-->     "First",
-->     "Second"
-->   ]
--> }
<-- HTTP/1.1 204 No Content
```

EXAMPLE 5: POST to the queue object URI two new values, one with base 64 transfer encoding and one with utf-8 transfer encoding:

```
--> POST /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> 
--> { 
-->   "mimetype": [ 
-->     "text/plain",
-->     "text/plain",
-->     "application/json"
-->   ],
-->   "valuetransferencoding": [ 
-->     "utf-8",
-->     "base64",
-->     "json"
-->   ],
-->   "value": [ 
-->     "First",
-->     "U2Vjb25k",
-->     { 
-->       "value" : "test"
-->     }
-->   ]
--> }
<-- HTTP/1.1 204 No Content
```
EXAMPLE 6: POST to the queue object URI the binary contents of two new values using multi-part MIME:

```
--> POST /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: multipart/mixed; boundary=gc0p4JqOM2Yt08j34c0p
--> 
--> --gc0p4JqOM2Yt08j34c0p
--> Content-Type: application/cdmi-queue
--> 
--> {}

--> --gc0p4JqOM2Yt08j34c0p
--> Content-Type: application/octet-stream
--> Content-Transfer-Encoding: binary

--> <20 bytes of binary data>

--> --gc0p4JqOM2Yt08j34c0p
--> Content-Type: application/octet-stream
--> Content-Transfer-Encoding: binary

--> <37 bytes of binary data>

--> --gc0p4JqOM2Yt08j34c0p--

<-- HTTP/1.1 204 No content
```

EXAMPLE 7: POST to the queue object URI the mime types and binary contents of two new values using multi-part MIME:

```
--> POST /cdmi/2.0.0/MyContainer/MyQueue HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: multipart/mixed; boundary=gc0p4JqOM2Yt08j34c0p
--> 
--> --gc0p4JqOM2Yt08j34c0p
--> Content-Type: application/cdmi-queue
--> 
--> {}

--> "mimetype" : [
-->   "application/pdf",
-->   "image/jpeg"
--> ]

--> 

--> --gc0p4JqOM2Yt08j34c0p
--> Content-Type: application/octet-stream
--> Content-Transfer-Encoding: binary

--> <20 bytes of binary data>

--> --gc0p4JqOM2Yt08j34c0p
--> Content-Type: application/octet-stream
--> Content-Transfer-Encoding: binary

--> <37 bytes of binary data>

--> --gc0p4JqOM2Yt08j34c0p--

<-- HTTP/1.1 204 No content
```
11.8 Delete a queue object value using CDMI

11.8.1 Synopsis

To delete one or more of the oldest enqueued values in an existing queue, the following request shall be performed:

- DELETE <root URI>/<ContainerName>/<QueueName>?value
- DELETE <root URI>/<ContainerName>/<QueueName>?values=<count>
- DELETE <root URI>/<ContainerName>/<QueueName>?values=<range>
- DELETE <root URI>/cdmi_objectid/<QueueObjectID>?value
- DELETE <root URI>/cdmi_objectid/<QueueObjectID>?values=<count>
- DELETE <root URI>/cdmi_objectid/<QueueObjectID>?values=<range>

Where:

- <root URI> is the path to the CDMI cloud.
- <ContainerName> is zero or more intermediate containers.
- <QueueName> is the name of the queue object to be deleted from.
- <QueueObjectID> is the ID of the queue object to be deleted from.
- <count> is the number of values, starting from the oldest, to be removed from the queue object. If more queue object entries are requested to be deleted than exist in the queue object, the count shall be considered equal to the number of entries in the queue object.
- <range> is the lowest to highest numbers as found in the queueValues field that are to be removed from the queue object. The first range value shall be smaller or equal to the lowest queue value. If the first range value is smaller than the lowest queue value, the lowest existing queue value shall be used. If the first range value is larger than the lowest queue value, an HTTP status code of 400 Bad Request shall be returned to the client. If the second range value is higher than the highest existing queue value, the highest existing queue value shall be used, which allows for idempotent queue value deletion.

The “?value” suffix at the end of the queue resource URI shall be included to distinguish the deletion of the oldest value from the deletion of the queue object itself, as described in 11.6 (which deletes all enqueued values).

11.8.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 122.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_modify_value</td>
<td>Queue object</td>
<td>Ability to delete a value from an existing queue object</td>
</tr>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide capability</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

11.8.3 Request header

Request headers can be provided as per RFC 2616 [23].

11.8.4 Request message body

A request body can be provided as per RFC 2616 [23].
11.8.5 Response headers

Response headers can be provided as per RFC 2616 [23].

11.8.6 Response message body

A response body can be provided as per RFC 2616 [23].

11.8.7 Response status

Table 123 describes the HTTP status codes that occur when deleting a queue object value using CDMI.

Table 123: HTTP status codes - Delete a queue object value using CDMI

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204 No Content</td>
<td>The queue object value was successfully deleted.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>The operation conflicts with a non-CDMI access protocol lock or has caused a state transition error on the server.</td>
</tr>
</tbody>
</table>

11.8.8 Examples

EXAMPLE 1: DELETE to the queue object URI value to delete the oldest enqueued value:

```
--> DELETE /cdmi/2.0.0/MyContainer/MyQueue?value HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```

EXAMPLE 2: DELETE to the queue object URI value to remove the ten oldest values:

```
--> DELETE /cdmi/2.0.0/MyContainer/MyQueue?values=10 HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```

EXAMPLE 3: DELETE to the queue object URI value to remove queue values 10 through 19:

```
--> DELETE /cdmi/2.0.0/MyContainer/MyQueue?values=10-19 HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 204 No Content
```
Clause 12

Capability object resource operations using CDMI

12.1 Overview

Capability objects indicate what specific functionality and operations are supported by a given CDMI server, and allow CDMI clients to discover what subset of this International Standard is implemented.

All CDMI servers shall support capabilities and the ability for CDMI clients to read capabilities.

Each CDMI capability object is represented as a JSON object, containing one or more “fields”. For example, the “capabilities” field contains specific capability items.

EXAMPLE 1: CDMI capability object

```json
{
    "objectType": "application/cdmi-capability",
    "objectID": "00007E7F0010128E42D87EE34F5A6560",
    "objectName": "cdmi_capabilities/",
    "parentURI": "/",
    "parentID": "00007E7F0010128E42D87EE34F5A6560",
    "capabilities": {
        "cdmi_domains": "true",
        "cdmi_export_nfs": "true",
        "cdmi_export_iscsi": "true",
        "cdmi_queues": "true",
        "cdmi_notification": "true",
        "cdmi_query": "true",
        "cdmi_metadata_maxsize": "4096",
        "cdmi_metadata_maxitems": "1024"
    },
    "childrenrange": "0-3",
    "children": ["domain/", "container/", "dataobject/", "queue/"]
}
```

The meaning, use, and permitted values of each field is described in 12.3.
12.2 Capability object details

12.2.1 Capability object addressing

Capability objects are addressed in CDMI in two ways:

• by name (e.g. https://cloud.example.com/cdmi/2.0.0/cdmi_capabilities/);

• by ID (e.g. https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/
  → 00007E7F00104BE66AB53A9572F9F51E/).

Every capability object has a single, globally-unique object ID that remains constant for the life of the object. Each capability object may also have one or more URI addresses that allow the capability object to be accessed.

When a capability object is addressed via more than one unique URIs, all operations may be performed through any of these URIs. For example, a capability object may be accessible via multiple virtual hosting paths, where https://cloud.example.com/cdmi/2.0.0/users/snia/cdmi_capabilities/ is also accessible through https://snia.example.com/cdmi/2.0.0/cdmi_capabilities/.

Following the URI conventions for hierarchical paths, capability URIs shall consist of one or more capability names that are separated by forward slashes (“/”) and that end with a forward slash (“/”).

If a request is performed against an existing capability resource and the trailing slash at the end of the URI is omitted, the server shall respond with an HTTP status code of 301 Moved Permanently. In addition, a Location header containing the URI with the trailing slash added shall be returned.

Capabilities may also be nested.

EXAMPLE 2: The following URI represents a nested capability:

https://cloud.example.com/cdmi/2.0.0/cdmi_capabilities/container/

A nested capability has a parent capability object, and shall be included in the children field of the parent capability object.

12.2.2 Capability object fields

Every CDMI object (excluding capability objects) includes a server-generated "capabilitiesURI" field that contains the URI of the capabilities object that describes which operations are permitted for that CDMI object.

Fig. 8 (shown on the next page) shows the hierarchy of capabilities and shows how the capabilitiesURI links data objects, container objects, queue objects and domain objects into the capabilities tree.

System-wide capabilities are described by the root capabilities object, which is accessible at "<root URI>/
  cdmi_capabilities/".

Capabilities cannot be altered by clients, but may be changed by the CDMI server to reflect configuration changes or operational changes. For example, if a CDMI server is upgraded or reconfigured, additional capabilities may become present, or existing capabilities may no longer be present. In practice, capabilities rarely change, and a client can assume that they shall remain constant for the duration of a client-server HTTP/HTTPS session.

Cloud clients should use capabilities to discover what operations are supported. If an operation is attempted on a CDMI object that does not have a corresponding capability, an HTTP status code of 400 Bad Request shall be returned to the client.

The capabilities defined as part of this International Standard are described starting in 12.2.7. Vendor-defined capabilities not specified in this International Standard shall not start with "cdmi_".

12.2.3 Capability object metadata

Capability objects do not have metadata.
12.2.4 Capability object access control

Capability objects are not subject to CDMI ACLs. Any authenticated CDMI client shall be capable of reading all Capability objects. Capabilities may differ from the operations permitted by an Access Control List (ACL) (see 17.1) associated with a given object. For example, a read-only cloud may not permit write access to a container or object, despite the presence of an ACL allowing write access.

12.2.5 Queue object consistency

Capability objects are read-only.

12.2.6 Capability object representations

The representations in this clause are shown using JSON notation. Both clients and servers shall support UTF-8 JSON representation. The request and response body JSON fields may be specified or returned in any order, with the exception that, if present, for capability objects, the "childrenrange" and "children fields" shall appear last and in that order.

---

1 A CDMI Server may filter the visibility of capability objects and/or capability items for security purposes, for example, to prevent the client discovery of the names and characteristics of classification levels above the client's maximum classification level. Such filtering is out of scope of this International Standard.
### 12.2.7 Cloud storage system-wide capabilities

Table 124 defines the system-wide capabilities in a cloud storage system. These capabilities, which are found in the capabilities object, are referred to by the root URI (root capabilities).

<table>
<thead>
<tr>
<th>Capability name</th>

### 12.2.9 Data system metadata capabilities

Table 126 defines the capabilities that indicate which data system metadata items are interpreted for objects stored in a cloud storage system. These capabilities are found in the capabilities objects for domains, data objects, containers, and queues. See 16.3 for a description of the meaning of the corresponding data system metadata items.

</table>
| cdmi_infrastructure_redundancy | JSON string | If present, the CDMI server supports the cdmi_infrastructure_redundancy data system metadata as defined in 16.3.  
When present, this capability shall contain a string set to a positive numeric string representing the maximum value that the server supports. |
| cdmi_latency    | JSON string         | If present and "true", the CDMI server supports the cdmi_latency data system metadata as defined in 16.3. |
| cdmi_RPO        | JSON string         | If present and "true", the CDMI server supports the cdmi_RPO data system metadata as defined in 16.3. |
| cdmi_RTO        | JSON string         | If present and "true", the CDMI server supports the cdmi_RTO data system metadata as defined in 16.3. |
| cdmi_sanitization_method | JSON array of JSON strings     | If present, the CDMI server supports the cdmi_sanitization_method data system metadata as defined in 16.3.  
When present, this capability shall contain one or more JSON strings, each string corresponding to a sanitization method as described in the cdmi_sanitization_method data system metadata in 16.3.  
When a cloud storage system supports sanitization, the system-wide capability of cdmi_security_sanitization specified in Table 124 of 12.2.7 shall be present and set to "true". |
| cdmi_throughput | JSON string         | If present and "true", the CDMI server supports the cdmi_throughput data system metadata as defined in 16.3. |
| cdmi_value_hash | JSON array of JSON strings     | If present, the CDMI server supports the cdmi_value_hash data system metadata as defined in 16.3.  
When present, this capability shall contain one or more JSON strings, each string corresponding to an algorithm/length value as described in the cdmi_value_hash data system metadata in 16.3.  
When a cloud storage system supports value hashing, the system-wide capability of cdmi_security_data_integrity specified in Table 124 of 12.2.7 shall be present and set to "true". |
<p>| cdmi_enc_key_id | JSON string         | When the cloud storage system supports the cdmi_enc_key_id data system metadata as defined in clause 16.3, the cdmi_enc_key_id capability shall be present and set to the string value &quot;true&quot;. When this capability is absent, or present and set to the string value &quot;false&quot;, cdmi_enc_key_id data system metadata shall not be used. |
| cdmi_enc_value_sign_id | JSON string     | When the cloud storage system supports the cdmi_enc_value_sign_id data system metadata as defined in clause 16.3, the cdmi_enc_value_sign_id capability shall be present and set to the string value &quot;true&quot;. When this capability is absent, or present and set to the string value &quot;false&quot;, cdmi_enc_value_sign_id data system metadata shall not be used. |</p>

### 12.2.12 Domain object capabilities

Table 129 defines the capabilities for domains in a cloud storage system. (All capabilities refer to what may be done via CDMI content-type operations.)

<table>
<thead>
<tr>
<th>Capability name</th>
<th>Type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cdmi_create_domain</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to add a new subdomain.</td>
</tr>
<tr>
<td><code>cdmi_delete_domain</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to delete a domain.</td>
</tr>
<tr>
<td><code>cdmi_move_domain</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to move a domain.</td>
</tr>
<tr>
<td><code>cdmi_domain_summary</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to support domain summaries.</td>
</tr>
<tr>
<td><code>cdmi_domain_members</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to support domain user management.</td>
</tr>
<tr>
<td><code>cdmi_list_children</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to list the domain's children.</td>
</tr>
<tr>
<td><code>cdmi_read_metadata</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to read the domain's metadata.</td>
</tr>
<tr>
<td><code>cdmi_modify_metadata</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to modify the domain's metadata.</td>
</tr>
<tr>
<td><code>cdmi_modify_deserialize_\to_\text{domain}</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to deserialize a serialized domain object into the domain object as an update.</td>
</tr>
<tr>
<td><code>cdmi_copy_domain</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to copy the domain (via PUT) to another URI.</td>
</tr>
<tr>
<td><code>cdmi_deserialize_domain</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to deserialize serialized domains and associated serialized children into the domain.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Capability name</th>
<th>Type</th>
<th>Definition</th>
</tr>
</thead>
</table>
| cdmi_authentication_methods | JSON array of JSON strings        | If present, the CDMI server supports authentication methods that are supported by a domain. When present, this capability shall contain one or more of the following JSON strings:  
  • “anonymous” - Absence of authentication supported  
  • “basic” - HTTP basic authentication supported (RFC 2617 [8])  
  • “digest” - HTTP digest authentication supported (RFC 2617 [8])  
  • “krb5” - Kerberos authentication supported, using the Kerberos domain specified in the CDMI domain (RFC 4559 [14])  
  • “x509” - certificate-based authentication via TLS (RFC 5246 [25], RFC 8446 [24])  
  • “s3” - S3 API signed header authentication supported  
  • “openstack” - OpenStack Identity API header authentication supported  
Interoperability with these authentication methods are not defined by this International Standard. Servers may include other authentication methods not included in the above list. In these cases, it is up to the CDMI client and CDMI server to ensure interoperability.
### 12.2.13 Queue object capabilities

Table 130 defines the capabilities for queue objects in a cloud storage system.

<table>
<thead>
<tr>
<th>Capability name</th>
<th>Type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_read_value</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to read a queue's value.</td>
</tr>
<tr>
<td>cdmi_read_metadata</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to read the queue's metadata.</td>
</tr>
<tr>
<td>cdmi_modify_value</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to modify the queue's value.</td>
</tr>
<tr>
<td>cdmi_modify_metadata</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to modify the queue's metadata.</td>
</tr>
<tr>
<td>cdmi_modify_deserialize_queue</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to deserialize a serialized queue into the queue as an update.</td>
</tr>
<tr>
<td>cdmi_delete_queue</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to delete a queue.</td>
</tr>
<tr>
<td>cdmi_move_queue</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to move a queue to another URI.</td>
</tr>
<tr>
<td>cdmi_copy_queue</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the CDMI server shall support the ability to copy a queue to another URI.</td>

</tbody>
</table>
12.3 Read a capabilities object using CDMI

12.3.1 Synopsis

To read an existing capability object, the following requests shall be performed:

- GET <root URI>/cdmi_capabilities/<Capability>/<TheCapability>/
- GET <root URI>/cdmi_capabilities/<Capability>/<TheCapability>/?
  <fieldname>&<fieldname>&...
- GET <root URI>/cdmi_capabilities/<Capability>/<TheCapability>/?children=<range>&...
- GET <root URI>/cdmi_objectid/<CapabilityObjectID>/
- GET <root URI>/cdmi_objectid/<CapabilityObjectID>/?<fieldname>&<fieldname>&...
- GET <root URI>/cdmi_objectid/<CapabilityObjectID>/?children=<range>&...

Where:
- <root URI> is the path to the CDMI cloud.
- <Capability> is zero or more parent capabilities.
- <TheCapability> is the name specified for the capability to be read from.
- <fieldname> is the name of a field.
- <range> is a numeric range within the list of children.
- <prefix> is a matching prefix that returns all metadata items that start with the prefix value.
- <CapabilityObjectID> is the ID of the capability object to be read from.

12.3.2 Capabilities

Capabilities that indicate which operations are supported are shown in Table 131.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_object_access_by_ID</td>
<td>System wide</td>
<td>Ability to access the object by ID</td>
</tr>
</tbody>
</table>

12.3.3 Request headers

The HTTP request headers for reading a CDMI capabilities object using CDMI are shown in Table 132.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Header string</td>
<td>&quot;application/cdmi-capability&quot; or a consistent value as described in 5.5.2</td>
<td>Optional</td>
</tr>
</tbody>
</table>

12.3.4 Request message body

A request body shall not be provided.

12.3.5 Response headers

The HTTP response headers for reading a CDMI capabilities object using CDMI are shown in Table 133.
Table 133: Response headers - Read a capabilities object Using CDMI

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>&quot;application/cdmi-capability&quot;</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

12.3.6 Response message body

The response message body fields for reading a CDMI capabilities object using CDMI are shown in Table 134.

Table 134: Response message body - Read a capabilities object using CDMI

<table>
<thead>
<tr>
<th>Field name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>JSON</td>
<td>&quot;application/cdmi-capability&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectID</td>
<td>JSON</td>
<td>Object ID of the object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>objectName</td>
<td>JSON</td>
<td>Name of the object</td>
<td>Mandatory</td>
</tr>
<tr>

<td>URI for the parent object</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parentID</td>
<td>JSON</td>
<td>Object ID of the parent capability object.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>capabilities</td>
<td>JSON</td>
<td>The capabilities supported by the corresponding object. Capabilities in the &quot;/cdmi_capabilities&quot; object are system-wide capabilities. Capabilities found in children objects under &quot;/cdmi_capabilities&quot; correspond to the capabilities of a specific subset of objects.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>childrenrange</td>
<td>JSON</td>
<td>The child capabilities of the capability expressed as a range. If a range of child capabilities is requested, this field indicates the children returned as a range.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>children</td>
<td>JSON</td>
<td>Names of the children capabilities objects. For the root container capabilities, this includes &quot;domain/&quot;, &quot;container/&quot;, &quot;dataobject/&quot;, and &quot;queue/&quot;. Within each of these capabilities objects, further more specialized capabilities profiles may be specified by the CDMI server.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

If individual fields are specified in the GET request, only these fields are returned in the result body. Optional fields that are requested but do not exist are omitted from the result body.

12.3.7 Response status

Table 135 describes the HTTP status codes that occur when reading a capabilities object using CDMI.

Table 135: HTTP status codes - Read a capabilities object using CDMI

<table>
<thead>
<tr>
<th>HTTP status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 OK</td>
<td>The capabilities object content was returned in the response.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
<tr>
<td>406 Not Acceptable</td>
<td>The server is unable to provide the object in the content type specified in the Accept header.</td>
</tr>
</tbody>
</table>
12.3.8 Examples

EXAMPLE 1: GET to the root container capabilities URI to read all fields of the container:

```
--> GET /cdmi/2.0.0/cdmi_capabilities/ HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-capability

<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-capability
<--
<-- {
<--     "objectType": "application/cdmi-capability",
<--     "objectID": "00007E7F00104BE66AB53A9572F9F51E",
<--     "objectName": "cdmi_capabilities/",
<--     "parentURI": "/",
<--     "parentID": "00007E7F0010128E42D87EE34F5A6560",
<--     "capabilities": {
<--         "cdmi_domains": "true",
<--         "cdmi_export_nfs": "true",
<--         "cdmi_export_iscsi": "true",
<--         "cdmi_queues": "true",
<--         "cdmi_notification": "true",
<--         "cdmi_query": "true",
<--         "cdmi_metadata_maxsize": "4096",
<--         "cdmi_metadata_maxitems": "1024"
<--     },
<--     "childrenrange": "0-3",
<--     "children": [
<--         "domain/",
<--         "container/",
<--         "dataobject/",
<--         "queue/
<--     ]
<-- }
```

EXAMPLE 2: GET to the root container capabilities URI to read the capabilities and children of the container:

```
--> GET /cdmi/2.0.0/cdmi_capabilities/?capabilities&children HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cdmi-capability

<-- HTTP/1.1 200 OK
<-- Content-Type: application/cdmi-capability
<--
<-- {
<--     "capabilities": {
<--         "cdmi_domains": "true",
<--         "cdmi_export_nfs": "true",
<--         "cdmi_export_iscsi": "true",
<--         "cdmi_queues": "true",
<--         "cdmi_notification": "true",
<--         "cdmi_query": "true",
<--         "cdmi_metadata_maxsize": "4096",
<--         "cdmi_metadata_maxitems": "1024"
<--     },
<--     "children": [
<--         "domain/",
<--         "container/",
<--         "dataobject/",
<--         "queue/
<--     ]
<-- }
```
EXAMPLE 3: GET to the root container capabilities URI to read the first two children contained within a domain:

```plaintext
---
GET /cdmi/2.0.0/cdmi_capabilities/?childrenrange&children=0-1 HTTP/1.1
Host: cloud.example.com
Accept: application/cdmi-capability

HTTP/1.1 200 OK
Content-Type: application/cdmi-capability

{
  "childrenrange": "0-1",
  "children": [
    "domain/",
    "container/"
  ]
}
---
```
Clause 13

Exported protocols

13.1 Overview

Container objects can be exported via multiple storage protocols. This is specified by adding an exports field to the container object. The exports field contains zero or more named exports, each of which has elements corresponding to the export protocol type, such as:

- The type of export protocol;
- The user-facing identity of the exported container, where required by the export protocol (e.g. iSCSI target, NFS directory);
- The domain of the protocol name server for the clients being served, where required by the export protocol;
- The list of who may mount that container via that protocol, as standardized by that protocol or optionally by leveraging the name mapping protocol (see 13.2.3) and specifying CDMI-resolvable user or groupnames;
- Required protocol-specific export parameters;
- Optional protocol-specific export parameters; and
- Export control parameters.

The ability to export containers via a specific protocol is determined by the presence or absence of a cdmi_export_<protocol> system wide capabilities, which are listed in 12.2.7. The ability to export a specific container via a specific protocol is indicated by the cdmi_export_<protocol> capability.

Exports are represented as a JSON object having zero or more named protocol-specific exports.

The meaning, use, and permitted values for the fields associated with each export type are described later in this clause.
13.2 Container object export details

13.2.1 Container object export addressing

Container object exports are addressed in CDMI in two ways:

- by name (e.g. https://cloud.example.com/cdmi/2.0.0/container/?exports);
- by ID (e.g. https://cloud.example.com/cdmi/2.0.0/cdmi_objectid/00007ED900104E1D14771DC67C27BF8B/?exports).

See 9.1 for more details on container object addressing.

13.2.2 Container object export fields

The export of a container, via data path protocols other than CDMI, is accomplished by creating or updating a container and supplying one or more export protocol structures, one for each such protocol. In this International standard, all such protocols are referred to as foreign protocols.

This International standard defines JSON export structures for several well known foreign protocols. All depend on the following user and groupname mapping feature in the case that multi-protocol access to the container is desired. However, name mapping is not required if an external domain is used, or if CDMI is used only to provision containers to be used exclusively by foreign protocols.

Implementations that support authenticated and authorized access to CDMI objects via both CDMI and foreign protocols need a way to support the setting of security on a per-object basis. The numerous methods of doing this include:

- Defining or adopting a security scheme and mapping all requests into that scheme. CDMI implementations that adopt this scheme shall use a name mapping technique to accomplish it, as (a) this mapping is easier for administrators to manage than straight id-to-id mapping, and (b) it is desired that interoperable CDMI implementations behave similarly in this respect. This means that the name of the principal in an incoming request is mapped to the name of a principal in the security domain, and that principal’s id is acquired and used in the authorization procedure.
- Allowing each protocol to set its own security, which implies that an object might be accessible to a given user via one protocol but not another.
- Using the security scheme of the last protocol that was used to set permissions on the object. This method also requires mapping the principal in the incoming request to a principal in the security domain of the object. As in the first case, the server shall use a name mapping procedure to obtain the id that is used to authorize the user against the desired object’s ACL.

CDMI does not mandate which method shall be used. It does, however, specify how users and groups shall be mapped between protocols.

13.2.3 Mapping names from CDMI to another protocol

Clients wishing to restrict exports via foreign protocols to mounting only by certain users and groups may be required to provide user and groupname mapping information to the server. This mapping information is also required if access to the container is desired by multiple protocols, e.g., both CDMI and NFS. The mapping is done as follows.

1. When a CDMI container is exported, the server should use the appropriate mechanism, e.g., Powershell WmiClass.Create( ) on the Windows platform or /etc(exports on Unix, to limit permitted mounts of the share from other servers, as specified in the "root_hosts","rw_hosts" and "ro_hosts" lines of the "exports" property. The syntax of each hosts line follows the syntax of /etc/exports in the Linux operating system, as encoded in a JSON string. If the CDMI server is unable to limit mounts as specified by each hosts line, an error shall result, but the success or failure of the operation depends on the implementation.

2. When possible, authentication credential resolution should be consistent across both CDMI and all exported protocols.

3. Authentication credential resolution shall be performed in the following order: #. CDMI Domain membership mapping (See 10.4), #. Delegated domain mapping (See 10.4), #. Export name mapping.

4. Implementations may ignore or override export name mapping as required to enforce implementation-specific security policies.
5. The usermap list for that protocol shall be searched, in order, for an entry matching the username obtained from
the authentication credential resolution process (see 13.2.7 for details on the search).

6. The CDMI principal name obtained from the first matching usermap entry during this search is then used to
authorize the user request via the security mechanism of the protocol whose security governs access to the
object.

Groupname mapping for each foreign protocol shall be specified in a groupname field of the foreign protocol export
specification. Its syntax is identical to the syntax for the username field.

13.2.4 Administrative users

By default, the following users shall be considered “root”, or administrative users, and equivalent to each other:

- root (Unix/NFS/LDAP),
- Administrator (Windows/AD/SMB), and
- the domain owner (CDMI).

Servers shall automatically map these users to the root user of the target protocol unless otherwise instructed by the
usermaps.

As an automatic mapping does not meet strict security standards, servers shall override these built-in entries with any
usermap entries that apply to one or more root users.

In the following example, root gets mapped to nobody, and everyone else is mapped to a user of the same name in the
NFS domain and the CDMI domain.

EXAMPLE 1: NFS export user mapping

```json
--> PUT /cdmi/2.0.0/MyContainer HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/vnd.org.snia.cdmi.container+json
--> Content-Type: application/vnd.org.sニア.cdmi.container+json
--> {
  "exports": {
    "nfs": {
      "usermap": [
        ["nobody", ", root"],
        ["", ",
        ["", ",
        ["", ","],
        ["", ","]
      ]
    }
  }
}
```

13.2.5 Mapping domains from CDMI to another protocol

The internet domain name corresponding to each exported CDMI container shall be described in the “domain” element
of the protocol export specification as a JSON-formatted string. If the “domain” element is not present in the protocol
export specification, it shall be assumed the domain is the same as the server hosting the CDMI implementation.

13.2.6 Permissions mapping

Security authorizations and entitlements may not directly correspond across users, groups, file system protocols, oper-
ating systems, enterprises or different cloud provider environments. CDMI’s primary area of concern is representing a
rich set of network files system authorizations and entitlements in a CDMI Access Control List (ACL).
As there are a number of possible ways to coordinate the permissions/ACLs and CDMI ACLs, this International specification does not mandate a particular method. However, all mappings of user and groupnames between domains shall use the name mapping mechanism specified in 13.2.7.

### 13.2.7 User and groupname mapping syntax and evaluation rules

A BNF-style grammar for name mapping is as follows:

```plaintext
ame_mapping_list = protocol protocol mapping_list
protocol = "cdmi" | "nfs" | "smb" | "ldap"
mapping_list = name mapping_operator name
name = pattern | utf8_name | quoted_utf8_name
quoted_utf8_name = " utf8_name "
utf8_name = < any legal utf8 character sequence not including the characters ",',\,,;,",?,>
pattern = <utf8_name> * | *
mapping_operator = "<--" | "<--" | "-->"
```

To restate this in English, a mapping entry consists of two names separated by a directional indicator. As most environments use the same usernames and groupnames across administrative domains, the most common mapping is "* <---> *", which maps any name to the same name in the foreign protocol domain, and vice versa. It is highly recommended that this be both the default map and the last entry on all more complex maps.

CDMI specifies pattern matching on names in the name map, but only prefix matching is required. The symbol "*" at the end of a character string shall match zero or more occurrences of any non-whitespace character.

Evaluation of the name mapping list shall proceed in order; once a match is made, evaluation shall cease and the result of the match shall be returned.

If no matches are found on the match list, the result is system dependent. However, it is recommended that servers either deny access altogether or map the user in question to the equivalent of "anonymous" on the destination protocol. It is also recommended that an entry be devoted to the special user "EVERYONE@".
### 13.3 NFS exported protocol

An NFS export specifies the information required by an NFS server to provide an NFS export. Normally, this information is contained in the `/etc/exports` file on a server or the equivalent.

Elements for an NFS export are described in Table 136.

<table>
<thead>
<tr>
<th>Element</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>JSON String</td>
<td>The export type is set to &quot;NFS&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>protocol</td>
<td>JSON String</td>
<td>The protocol being requested. Values shall be &quot;NFSv3&quot;, &quot;NFSv4&quot;, or any subsequent NFS version enshrined in an IETF RFC. Version 2 of NFS is not supported by CDMI.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>path</td>
<td>JSON String</td>
<td>The pathname to which the export should be surfaced. This value shall be a UTF8 string of the form <code>&lt;server&gt;:/&lt;path&gt;</code>, where the <code>&lt;server&gt;</code> component is optional, (e.g., <code>myserver:/lessons/number1</code>). If specified, the <code>&lt;server&gt;</code> component of the path must be obtained from an administrator of the service running the CDMI implementation.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>usermap</td>
<td>JSON Array of JSON Arrays</td>
<td>Authentication credential mapping of user names, as specified in 13.2.3.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>groupmap</td>
<td>JSON Array of JSON Arrays</td>
<td>Authentication credential mapping of group names, as specified in 13.2.3.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>encryption</td>
<td>JSON String</td>
<td>This value shall be &quot;rpcsec_gss&quot; or future TLS-based transport security.</td>
<td>Optional</td>
</tr>
<tr>
<td>domain_servers</td>
<td>JSON Array of JSON Strings</td>
<td>A list of server names or IP addresses that function as name servers for the domain given in &quot;domain&quot;. If given, this list shall override the names obtainable by the CDMI server via other programmatic means.</td>
<td>Optional</td>
</tr>
<tr>
<td>mount_name</td>
<td>JSON String</td>
<td>The name the client should use to surface the export. This name replaces the last name in the path string, (e.g., mounting &quot;myserver:/lessons/number1&quot; with a mountname of &quot;1&quot; over the directory <code>/somepath/lessons/num1</code> should result in a <code>/somepath/lessons/1</code> directory on the client).</td>
<td>Optional</td>
</tr>
<tr>
<td>root_hosts</td>
<td>JSON Array of JSON Strings</td>
<td>A list of names of hosts that may access the container in superuser mode. The default shall be an empty list.</td>
<td>Optional</td>
</tr>
<tr>
<td>rw_hosts</td>
<td>JSON Array of JSON Strings</td>
<td>A list of names of hosts that may access the container in <code>rw</code> mode. The default shall be an empty list.</td>
<td>Optional</td>
</tr>
<tr>
<td>ro_hosts</td>
<td>JSON Array of JSON Strings</td>
<td>A list of names of hosts that may access the container in <code>ro</code> mode only. The default shall be an empty list.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
Table 136 – continued from previous page

<table>
<thead>
<tr>
<th>Element</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>recurse</td>
<td>JSON String</td>
<td>This value shall be either &quot;true&quot; or &quot;false&quot;. The default shall be &quot;true&quot;. When true, recurse indicates that mounts within the CDMI directory structure (presumably put there by other NFS operations) shall be followed and the mounted directory exposed as though it were part of the CDMI container actually being exported. This parameter is equivalent to the Linux &quot;crossmnt&quot; parameter.</td>
<td>Optional</td>
</tr>
<tr>
<td>parameters</td>
<td>JSON String</td>
<td>A string containing NFS server-specific parameters to be passed to the NFS server. The format of this string is implementation specific. The default shall be an empty string.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

Servers shall support wildcard matching on the "*" and "?" characters in the hosts lists, so that "*.cs.uscs.edu" matches all servers in the cs.ucsc.edu department.

Servers may also support IP address ranges in the various lists of hosts. These IP addresses shall be augmented by the same wildcard matching as is used for ordinary host names (e.g., "192.168.1.*" exports to all the machines on local class C network).

Servers shall return an HTTP status code of 400 Bad Request when an export setting does not conform to an allowable setting on the server.

EXAMPLE 2: NFS exports

```json
{
    "exports": {
        "1": {
            "type": "nfs",
            "protocol": "NFSv4",
            "path": "/myexport",
            "domain_servers": "lab.example.com",
            "root_hosts": [ "admin.lab.example.com" ],
            "ro_hosts": [ "*.lab.example.com" ],

        }
    }
}
```
### 13.4 SMB exported protocol

An SMB export specifies the information required by an SMB server to provide an SMB export. Elements for an SMB export are described in Table 137.

<table>
<thead>
<tr>
<th>Element</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>JSON String</td>
<td>The export type is set to “SMB”</td>
<td>Mandatory</td>
</tr>
<tr>
<td>sharename</td>
<td>JSON String</td>
<td>The name that SMB shall use to discover the share.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>usermap</td>
<td>JSON Array of JSON Arrays</td>
<td>Authentication credential mapping of user names, as specified in 13.2.3.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>groupmap</td>
<td>JSON Array of JSON Arrays</td>
<td>Authentication credential mapping of group names, as specified in 13.2.3.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>root_hosts</td>
<td>JSON Array of JSON Strings</td>
<td>A list of names of hosts that may access the container in superuser mode. The default shall be an empty list.</td>
<td>Optional</td>
</tr>
<tr>
<td>rw_hosts</td>
<td>JSON Array of JSON Strings</td>
<td>A list of names of hosts that may access the container in rw mode. The default shall be an empty list.</td>
<td>Optional</td>
</tr>
<tr>
<td>ro_hosts</td>
<td>JSON Array of JSON Strings</td>
<td>A list of names of hosts that may access the container in ro mode only. The default shall be an empty list.</td>
<td>Optional</td>
</tr>
<tr>
<td>domain_servers</td>
<td>JSON Array of JSON Strings</td>
<td>A list of server names or IP addresses that function as name servers for the domain given in &quot;domain&quot;. If given, this list shall override the names obtainable by the CDMI server via other programmatic means.</td>
<td>Optional</td>
</tr>
<tr>
<td>comment</td>
<td>JSON String</td>
<td>This value shall be JSON String containing a user-friendly share name for the client.</td>
<td>Optional</td>
</tr>
<tr>
<td>parameters</td>
<td>JSON String</td>
<td>A string containing SMB server-specific parameters to be passed to the SMB server. The format of this string is implementation specific. The default shall be an empty string.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

Servers shall return an HTTP status code of 400 Bad Request when an export setting does not conform to an allowable setting on the server.

**EXAMPLE 3: SMB exports**

```json
{
    "exports": {
        "1": {
            "type": "smb",
            "rw_hosts": [ "*" ],
            "domain_servers": "lab.mycollege.edu",
            "usermap": {
                "jimsmith", "<-->", "james.smith"
            },
            "groupmap": {
                "admins", "<--", "Administrators"
            }
        }
    }
}
```

(continues on next page)
13.5 iSCSI exported protocol

An iSCSI export specifies the information required by an iSCSI server (see RFC 7143 [4]) to provide an iSCSI export. Each container is exported as a single SCSI Logical Unit as a Logical Unit Number (LUN). One or more iSCSI initiators import the LUN through an iSCSI target node and port using one or more iSCSI network portals (IP addresses).

Elements for an iSCSI export are described in Table 138

<table>
<thead>
<tr>
<th>Element</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>JSON String</td>
<td>The export type is set to “iSCSI”</td>
<td>Mandatory</td>
</tr>
<tr>
<td>permissions</td>
<td>JSON Array of JSON Strings</td>
<td>One or more target identifiers for initiators that are permitted to access the iSCSI export. Target identifiers may be in iqn, naa, or eui format and shall have the target portal group tag appended in hexadecimal. If absent, any initiator may access the export.</td>
<td>Optional</td>
</tr>
<tr>
<td>parameters</td>
<td>JSON String</td>
<td>A string containing iSCSI server-specific parameters to be passed to the iSCSI server. The format of this string is implementation specific. The default shall be an empty string.</td>
<td>Optional</td>
</tr>
<tr>
<td>target_identifier</td>
<td>JSON String</td>
<td>iSCSI target information (IP addresses or fully qualified domain names, target identifier, and LUN)</td>
<td>Read-Only</td>
</tr>
<tr>
<td>logical_unit_number</td>
<td>JSON String</td>
<td>iSCSI Logical Unit Number</td>
<td>Read-Only</td>
</tr>
<tr>
<td>logical_unit_name</td>
<td>JSON String</td>
<td>iSCSI Logical Unit Name</td>
<td>Read-Only</td>
</tr>
<tr>
<td>portals</td>
<td>JSON Array of JSON Strings</td>
<td>One or more IP addresses or fully qualified domain names through which the iSCSI export may be accessed. This field is server populated.</td>
<td>Read-Only</td>
</tr>
</tbody>
</table>

Servers shall return an HTTP status code of 400 Bad Request when an export setting does not conform to an allowable setting on the server.

EXAMPLE 4: iSCSI export creation

```
"exports": {
  "i": {
    "type": "iSCSI",
    "permissions": [ 
      "iqn.2010-01.com.acme:host1",
      "iqn.2010-01.com.acme:host2"
    ]
  }
}
```

EXAMPLE 5: Reading iSCSI export information after creation

```
"exports": {
  "i": {
    "type": "iSCSI",
    "ports": [ 
      "192.168.1.101",
      "192.168.1.102"
    ],
    "target_identifier": "iqn.2010-01.com.cloudprovider:acmeroot.container1,t,0x0001",
    "logical_unit_number": "3",
    "logical_unit_name": "0x60012340000000000000000000000001",
    "permissions": [ 
      "iqn.2010-01.com.acme:host1",
      "iqn.2010-01.com.acme:host2"
    ]
  }
}
```

(continues on next page)
(continued from previous page)
}
)}
13.6 WebDAV exported protocol

A WebDAV export specifies the information required by an WebDAV server (see RFC 4918 [6]) to provide an WebDAV export.

Elements for an WebDAV export are described in Table 139

<table>
<thead>
<tr>
<th>Element</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>JSON String</td>
<td>The export type is set to “WebDAV”</td>
<td>Mandatory</td>
</tr>
<tr>
<td>usermap</td>
<td>JSON Array of JSON Arrays</td>
<td>Authentication credential mapping of user names, as specified in 13.2.3.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>groupmap</td>
<td>JSON Array of JSON Arrays</td>
<td>Authentication credential mapping of group names, as specified in 13.2.3.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>parameters</td>
<td>JSON String</td>
<td>A string containing WebDAV server-specific parameters to be passed to the WebDAV server. The format of this string is implementation specific. The default shall be an empty string.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

Servers shall return an HTTP status code of 400 Bad Request when an export setting does not conform to an allowable setting on the server.

WebDAV supports locking, but it is up to implementations to support any locking of access through CDMI as a result, and the interaction between the two protocols is purposely not described in this International Standard.

EXAMPLE 6: WebDAV export

```json
"exports":
  
  "1": {
    "type": "WebDAV",
    "usermap": [
      { "*", "<-->", "*" }
    ],
    "groupmap": [
      { "*", "<-->", "*" }
    ]
  }
```
13.7 OCCI exported protocol

Container objects can be exported via multiple protocols. This is especially useful when CDMI is being used as a storage interface in a cloud computing environment, as illustrated in Fig. 9 below.

CDMI/OCCI Interface

In this example, CDMI containers may also be used as virtual disks by virtual machines in the cloud computing environment. The cloud computing infrastructure management is shown as implementing both an Open Cloud Computer Interface (OCCI) and CDMI interfaces. With the internal knowledge of the network and the virtual machine manager’s mapping of drives, this infrastructure may associate the CDMI containers to the guests using the appropriate exported protocol.

To support exported protocols and improve their interoperability with CDI, CDMI provides a type of exported protocol that contains information obtained via the OCCI interface. In addition, OCCI provides a type of storage that corresponds...
to a CDMI container that is exported with a specific type of protocol used by OCCI. A client of both interfaces performs operations that align the architectures, including the following:

- The client creates a CDMI container through the CDMI interface and exports it as an OCCI export protocol type. The CDMI container object ID is returned as a result.
- The client creates a virtual machine through the OCCI interface and attaches a storage volume of type CDMI using the object ID and protocol type. The OCCI virtual machine ID is returned as a result.
- The client updates the export protocol structure of the CDMI container object with the OCCI virtual machine ID to allow the virtual machine access to the container.
- The client starts the virtual machine through the OCCI interface.

CDMI defines an export protocol structure for the Open Cloud Computing Interface (13.7) as follows:

- The type is "OCCI/<protocol standard>" (e.g., "OCCI/NFSv4").
- The identifier is the CDMI container ID.
- A JSON array of URIs to OCCI compute resources shall have access (permissions) to the exported container.

**EXAMPLE 5: OCCI export**

```
"OCCI/iSCSI":
   "identifier": "00007E7F00104BE66AB53A9572F9F51E",
   "permissions":
     [ "https://example.com/compute/0/",
       "https://example.com/compute/1/
     ]
```

For more detail on using the OCCI export protocol structure attributes, see 13.1. Because the actual networking and access control is under the control of a hidden, common infrastructure that implements both OCCI and CDMI, the normal permission structure shall not be provided.
Clause 14

CDMI snapshots

14.1 Overview

A snapshot is a point-in-time copy (image) of a container and all of its contents, including subcontainers and all data objects and queue objects. The client names a snapshot of a container at the time the snapshot is requested. A snapshot operation creates a new container to contain the point-in-time image. The first processing of a snapshot operation also adds a cdmi_snapshots child container to the source container. Each new snapshot container is added as a child of the cdmi_snapshots container. The snapshot does not include the cdmi_snapshots child container or its contents (see Fig. 10).

```
PUT /source/
{
    "snapshot" : "snapshot_b"
}
```

Fig. 10: Snapshot container structure
14.2 Creating a snapshot

14.2.1 Operation context

A snapshot operation is requested using the container update operation (see 9.5), in which the snapshot field specifies the requested name of the snapshot.

A snapshot may be accessed in the same way that any other CDMI™ object is accessed. An important use of a snapshot is to allow the contents of the source container to be restored to their values at a previous point in time using a CDMI copy operation.

14.2.2 Example

EXAMPLE 1: PATCH to an existing container to create a snapshot:

```
--> PATCH /cdmi/2.0.0/MyContainer/ HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-container
<--
--> {  
-->   "snapshot": "MySnapshot"  
<-- }  
<-- HTTP/1.1 201 Created
```
14.3 Deleting a snapshot

14.3.1 Operation context

A snapshot can be deleted by performing a CDMI container delete operation on the corresponding child container in the cdmi_snapshots container, or by performing a CDMI container delete operation on the snapshot Object ID.

14.3.2 Example

EXAMPLE 1: DELETE to an existing snapshot:

```
--> DELETE /cdmi/2.0.0/MyContainer/cdmi_snapshots/MySnapshot HTTP/1.1
--> Host: cloud.example.com

<- HTTP/1.1 204 No Content
```
Clause 15

Serialization/deserialization

15.1 Overview

Bulk data movement is often needed between, into, or out of clouds. When moving bulk data, cloud serialization operations provide a means to normalize data to a canonical, self-describing format, which includes:

- data migration between clouds,
- data migration during upgrades (or replacements) of cloud implementations, and
- robust backup.

The canonical format of serialized data describes how the data is to be represented in a byte stream. As long as this byte stream is not changed during the transfer from source to destination, the data may be reconstituted on the destination system.
15.2 Canonical format

15.2.1 General requirements

Support for CDMI serialization using JSON as the canonical format requires the presence of the `cdmi_serialization_json` capability.

The canonical format shall represent specified data objects and container objects as they exist within the storage system.

Each object shall be represented by the metadata for the object, identifiers, and the data stream contents of the data object. Because data and storage system metadata is inherited from enclosing container objects, all parent metadata shall be represented in the top-level of the canonical format. To preserve the actual metadata values that apply to the data object that is being serialized, the non-overridden metadata is included from both the immediate parent container object of the specified object and from the parent of each higher-level container object.

The canonical format shall have the following characteristics:

• recursive JSON for the data object, consistent with the rest of CDMI;
• user and data system metadata for each data object/container object;
• data stream contents for each data object and queue object;
• binary data represented using escaped JSON strings; and
• typing of data values consistent with CDMI JSON representations.

15.2.2 Example JSON canonical serialized format

EXAMPLE 1: In this example, a data object and a queue object in a container object have been selected for serialization:

```json
{
    "objectType": "application/cdmi-container",
    "objectID": "00007E7F00102E230ED82694DA975D2",
    "objectName": "MyContainer/",
    "parentURI": "/",
    "parentID": "00007E7F0010128E42D87EE34F5A6560",
    "domainURI": "/cdmi_domains/MyDomain/",
    "capabilitiesURI": "/cdmi_capabilities/container/",
    "completionStatus": "Complete",
    "metadata": {
        ...
    },
    "exports": {
        "OCCI/iSCSI": {
            "identifier": "00007E7F00104BE66AB53A9572F9F51E",
            "permissions": [
                "https://example.com/compute/0/",
                "https://example.com/compute/1/
            ]
        },
        "Network/NFSv4": {
            "identifier": "/users",
            "permissions": "domain"
        }
    },
    "childrenrange": "0-1",
    "children": [
        {
            "objectType": "application/cdmi-object",
            "objectID": "00007E7F0010102E230ED82694DA975D2",
            "objectName": "MyDataObject.txt",
            "parentURI": "/MyContainer/",
            "parentID": "00007E7F00102E230ED82694DA975D2",
            "domainURI": "/cdmi_domains/MyDomain/",
            "capabilitiesURI": "/cdmi_capabilities/dataobject/",
            "completionStatus": "Complete",
            "mimetype": "text/plain",
            "metadata": {
```
Cloud Data Management Interface 2.0.0a

To allow efficient deserialization in stream mode when serializing container objects to JSON, data object value fields and container children arrays should be the last items in the canonical serialized JSON format.
15.3 Exporting serialized data

A canonical encoding of the data is obtained by creating a new data object and specifying that the source for the creation is to serialize a given CDMI™ data object, container object, or queue object. On a successful serialization, the result shall be a data object that is created with the serialized data as its value. If a container object has an exported block protocol, the serialized data may contain the block-by-block contents of that container object along with its metadata.

The resulting data object that is produced is the canonical representation of the selected data object, container object and children, or queue object.

- If the source specified is a data object, the canonical format shall contain all data object fields, including the value, valuetransferencoding, and metadata fields.

- If the source being specified is a queue object, the canonical format shall contain all queue object fields, including the value and valuetransferencoding fields of enqueued items, along with the metadata of the queue object itself.

- If the source being specified is a container object, the canonical format shall contain all container object fields, recursively, including all children of the container object. If a user attempts to serialize a container object that includes children that the user, who is performing the serialization operation, does not have permission to read, these objects shall not be included in the resulting serialized object.

When performing a serialization operation, objects shall only be included if the principal initiating the serialization has sufficient permissions to read those objects.
15.4 Importing serialized data

Canonical data may be deserialized back into the cloud by creating a new data object, container object, or queue object and by specifying that the source for the creation is to deserialize a given CDMI data object or by specifying the serialized data in base64 encoding in the deserializevalue field.

The destination may or may not exist previously. If not, a create operation is performed. If a container object already exists, an update operation with serialized children shall update the container object and all children. If the serialized container object does not contain children, only the container object is updated. Data objects are recreated as specified in the canonical format, including all metadata and the data object ID.

Table 140: Serialization import behaviour

<table>
<thead>
<tr>
<th>User has cross_domain</th>
<th>User specifies domainURI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>The domainURI of the parent object shall match the domainURI in each serialized object being deserialized. If the domainURI in any serialize object does not match the domainURI of the parent object, the entire deserialization operation shall fail, and an HTTP status code of 400 Bad Request shall be returned.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>The specified domainURI shall be used, overriding the original domainURI in each serialized object being deserialized. If a domainURI other than the domainURI of the parent is specified, the entire deserialization operation shall fail, and an HTTP status code of 400 Bad Request shall be returned.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>The original domainURI in each serialized object being deserialized shall be used. If any of the original domainURI in each serialized object being deserialized is not valid in the context of the storage system on which the deserialization operation is being performed, the entire deserialization operation shall fail, and an HTTP status code of 400 Bad Request shall be returned.</td>
</tr>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>The specified domainURI shall be used, overriding the original domainURI in each serialized object being deserialized. If a domainURI that is specified is not valid in the context of the storage system on which the deserialization operation is being performed, the entire deserialization operation shall fail, and an HTTP status code of 400 Bad Request shall be returned.</td>
</tr>
</tbody>
</table>

Deserialization operations shall restore all metadata from the specified source. If the original provider of the serialized data-supported vendor extensions is through custom metadata keys and values, then these customized requirements shall be restored when deserialized. However, the custom metadata keys and values may be treated as user metadata (preserved, but not interpreted) by the destination provider. Preservation allows custom data requirements to move between clouds without losing this information.
Clause 16

Metadata

16.1 Overview

CDMI metadata allows for additional information to be associated with stored objects. JSON objects, strings and arrays are used to transfer metadata in CDMI operations, which allows for metadata to be hierarchical. CDMI servers may place a restriction on the number of metadata items, maximum size per metadata item, and total size of metadata items, as specified in the `cdmi_metadata_maxitems`, `cdmi_metadata_maxsize`, and `cdmi_metadata_maxtotalsize` capabilities. CDMI servers shall not place a restriction on the depth of the metadata hierarchy and number of array items, outside of the above restrictions.

When objects are created, object metadata is created according to the following process:

1. Metadata items specified in the create operation are added, overriding pre-existing metadata items
2. Storage System metadata items are added to the object, overriding pre-existing metadata items subject to the restrictions described in Section 16.2

When objects are updated, object metadata is updated according to the following process:

1. Existing metadata items are deleted, changed and/or added, as specified in the update operation
2. Storage System metadata items are updated for the object, overriding pre-existing metadata items subject to the restrictions described in Section 16.2

When objects are read, object metadata is returned according to the following process:

1. Data System Metadata items is inherited from the parent container
2. Metadata items stored with the object are returned, overriding any inherited Data System Metadata items
16.2 Support for storage system metadata

After an object has been created or updated, the storage system metadata, as described in Table 141, shall be generated or updated by the cloud storage system, and shall immediately be made available to a CDMI client in the metadata that is returned as a result of the create operation and any subsequent retrievals.

Which storage system metadata is supported by the CDMI server defined in 12.2.8. Storage system metadata that is not supported by the CDMI server shall be preserved.

Table 141: Storage system metadata

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_size</td>
<td>JSON string</td>
<td>The number of bytes consumed by the object. This storage system metadata item is computed by the storage system, and any attempts to set or modify it will be ignored.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_ctime</td>
<td>JSON string</td>
<td>The time when the object was created, in ISO-8601 point-in-time format, as described in 5.6. For a newly created object, this value shall be set to the creation time. This metadata value may only be updated by a client if it has the &quot;backup_operator&quot; privilege. If a client does not have the backup operator privilege, updates of this metadata item shall be ignored.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_atime</td>
<td>JSON string</td>
<td>The time when the object was last accessed in ISO-8601 point-in-time format, as described in 5.6. The access or modification of a child is not considered an access of a parent container (access/modify times do not propagate up the tree). For a newly created object, this value shall be set to the creation time. This metadata value may only be updated by a client if it has the &quot;backup_operator&quot; privilege. If a client does not have the backup operator privilege, updates of this metadata item shall be ignored.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_mtime</td>
<td>JSON string</td>
<td>The time when the object was last modified, in ISO-8601 point-in-time format, as described in 5.6. The modification of a child is not considered a modification of a container object (modification times do not propagate up the tree). For a newly created object, this value shall be set to the creation time. This metadata value may only be updated by a client if it has the &quot;backup_operator&quot; privilege. If a client does not have the backup operator privilege, updates of this metadata item shall be ignored.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_acount</td>
<td>JSON string</td>
<td>The number of times that the object has been accessed since it was originally created. Accesses include all reads, writes, and lists. For a newly created object, this value shall be set to the value &quot;0&quot;. This metadata value may only be updated by a client if it has the &quot;backup_operator&quot; privilege. If a client does not have the backup operator privilege, updates of this metadata item shall be ignored.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_mcount</td>
<td>JSON string</td>
<td>The number of times that the object has been modified since it was originally created. Modifications include all value and metadata changes. Modifications to metadata resulting from reads (such as updates to atime) do not count as a modification. For a newly created object, this value shall be set to the value &quot;0&quot;. This metadata value may only be updated by a client if it has the &quot;backup_operator&quot; privilege. If a client does not have the backup operator privilege, updates of this metadata item shall be ignored.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_hash</td>
<td>JSON string</td>
<td>The hash of the value of the object, encoded using Base16 encoding rules described in RFC 4648 [19]. This metadata field shall be present when the &quot;cdmi_value_hash&quot; data system metadata for the object or a parent object indicates that the value of the object should be hashed. This storage system metadata item is computed by the storage system, and any attempts to set or modify it will be ignored.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_owner</td>
<td>JSON string</td>
<td>The name of the principal that has owner privileges for the object. If not specified when the object is created, this principal associated with the user creating the object shall be used. This metadata value can be updated by users with appropriate permissions.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_acl</td>
<td>JSON array of JSON objects</td>
<td>Standard ACL metadata as described in 17.1. If not specified when the object is created, the ACL metadata shall be generated in by the system. This metadata value can be updated by users with appropriate permissions.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_dac_uri</td>
<td>JSON string</td>
<td>Contains the URI used to submit a DAC request for the data object. URI schemes supported is defined in the cdmi_dac_methods capability. Both cdmi_dac_certificate and cdmi_dac_uri shall be included for delegated access control to be enabled for a given object.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_dac_certificate</td>
<td>JSON object</td>
<td>A JSON object, containing a JWE JWK which shall include a public key that is used to submit a DAC request for the data object, and should contains a X.509 certificate or certificate chain used to verify the identity of the DAC provider. Both cdmi_dac_certificate and cdmi_dac_uri shall be included for delegated access control to be enabled for a given object.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_enc_signature</td>
<td>JSON object</td>
<td>Contains JWS compact serialization of a signature for the entire object (value and metadata). See clause 23.7 for more details.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
16.3 Support for data system metadata

When specified, data system metadata, as described in Table 142, provides guidelines to the cloud storage system on how to provide storage data services for data managed through the CDMI interface.

Data system metadata is inherited from parent objects to any children objects. If a child object explicitly contains data system metadata, the metadata value of the child object data system metadata shall override any corresponding inherited metadata value of the parent object data system metadata.

Which data system metadata is supported by the CDMI server defined in 12.2.9. Data system metadata that is not supported by a CDMI server shall be preserved.

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_data_redundancy</td>
<td>JSON string</td>
<td>If this data system metadata item is present and set to a positive numeric string, it indicates that the client is requesting a desired number of complete copies. Additional copies may be made to satisfy demand for the value. When this data system metadata item is absent, or is present and is not set to a positive numeric string, this data system metadata item shall not be used.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_immediate_redundancy</td>
<td>JSON string</td>
<td>If this data system metadata item is present and set to &quot;true&quot;, it indicates that the client is requesting that at least the number of copies indicated in cdmi_data_redundancy contain the newly written value before the operation completes. This metadata is used to make sure that multiple copies of the data are written to permanent storage to prevent possible data loss. When this data system metadata item is absent, or is present and is not set to &quot;true&quot;, this data system metadata item shall not be used. If the requested number of copies cannot be created within the HTTP timeout period, the transaction shall complete, but the cdmi_immediate_redundancy_provided data system metadata shall be set to &quot;false&quot;.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_assignedsize</td>
<td>JSON string</td>
<td>If this data system metadata item is present and set to a positive numeric string, it indicates that the client is specifying the size in bytes that is desired to be reported for a container object exported via other protocols (see 9.2.3). The system is not required to reserve this space and may thin-provision the requested space. Thus, the requested value may be greater than the actual storage space consumed. When this data system metadata item is absent, or is present and is not set to a positive numeric string, this data system metadata item shall not be used. This data system metadata item is only applied against container objects and is not inherited by child objects.</td>
<td>Optional</td>

| cdmi_encryption | JSON   | If this data system metadata item is present and not an empty string, it indicates that the client is requesting that the object be encrypted while at rest. If encrypted, all data and metadata related to the object shall be encrypted. Supported algorithm/mode/length values are provided by the cdmi_encryption capability. When this data system metadata item is absent, this data system metadata item shall not be used. If this data system metadata item is present but does not contain a valid encryption algorithm/mode/length string, the system is free to choose to ignore the data system metadata, to fail with an HTTP status code of 400 Bad Request, or to select an encryption algorithm/mode/length of the system’s choice. Supported encryption algorithms are expressed as a string in the form of ALGORITHM_MODE_KEYLENGTH, where:  
  • "ALGORITHM" is the encryption algorithm (e.g., "AES" or "3DES").  
  • "MODE" is the mode of operation (e.g., "XTS", "CBC", or "CTR").  
  • "KEYLENGTH" is the key size in bytes (e.g., "128", "192", "256").  
  To improve interoperability between CDMI implementations, the following designators should be used for the more common encryption combinations:  
  • "3DES_ECB_168" for the three-key TripleDES algorithm, the Electronic Code Book (ECB) mode of operation, and a key size of 168 bits;  
  • "3DES_CBC_168" for the three-key TripleDES algorithm, the Cipher Block Chaining (CBC) mode of operation, and a key size of 168 bits;  
  • "AES_CBC_128" for the AES algorithm, the CBC mode of operation, and a key size of 128 bits;  
  • "AES_CBC_256" for the AES algorithm, the CBC mode of operation, and a key size of 256 bits;  
  • "AES_XTS_128" for the AES algorithm, the XTS mode of operation, and a key size of 128 bits; and  
  • "AES_XTS_256" for the AES algorithm, the XTS mode of operation, and a key size of 256 bits. | Optional     |

16.5 Support for user metadata

All CDMI objects that support metadata shall permit the inclusion of arbitrary user-defined metadata items, with the restriction that the name of a user-defined metadata item shall not start with the prefix "cdmi\".

- The maximum number of user-defined metadata items is specified by the capability `cdmi_metadata_maxitems`.
- The maximum size of each user-defined metadata item is specified by the capability `cdmi_metadata_maxsize`.
- The maximum total size of user-defined metadata items for an object is specified by the capability `cdmi_metadata_maxtotalsize`. 
16.6 Metadata update operations

CDMI permits a client to replace all metadata items or to perform operations against one or more individual metadata items.

Replacing all metadata items is accomplished by including the metadata field in the update request body JSON and not specifying specific metadata items in the update URI.

Adding, updating, and removing specific metadata items is accomplished by specifying the specific metadata item names in the update URI:

- To add a new metadata item to an existing object, the metadata item name shall be included in the update request URI, and the metadata item shall be included in the metadata field in the update request body JSON.

- To update the value of an existing metadata item, the metadata item name shall be included in the update request URI, and the metadata item shall be included in the metadata field in the update request body JSON.

- To remove an existing metadata item, the metadata item name shall be included in the update request URI, and the metadata item shall not be included in the metadata field in the update request body JSON.

When individual metadata items are specified in the update URI, metadata items included in the metadata field in the request body JSON that are not referred to in the update URI shall be ignored.
Access control

17.1 Overview

Access control defines the mechanisms by which access to objects are permitted or denied. The CDMI International Standard supports the following options for access control:

- No access control
- Access Control List (ACL) based access control (See §17.2.1)
- Domain based access control (See §10.2.5)
- Delegated access control (See clause 24)
- Vendor-defined access control extensions
- Combinations of the above
**17.2 Access control flow**

Fig. 11 illustrates the control flow for access control in an example CDMI implementation. As every aspect of access control is optional within a CDMI server, each different implementation will typically implement appropriate subsets of the illustrated access control flow, in a manner appropriate to the internal architecture of their implementation.

The full control flow can include 24 steps:

1. The CDMI client initiates a CDMI operation by sending a CDMI request to a CDMI server. As part of the request, the CDMI client includes information about its identity and information to prove this identity (credentials). The method by which these credentials are presented and formatted is not specified in this International Standard, however, some guidance is provided in 5.4.3.

2. If the CDMI server supports Domains (see clause 10), the CDMI server obtains the domain associated with the object the CDMI operation is being performed against. If the CDMI system does not support domains, steps 2 - 8 are skipped.

3. The CDMI server obtains required information about the domain associated with the object.

4. Domain Information is returned for further use.

5. Domain information is used to resolve CDMI client credentials.

6. If the Domain is configured to delegate identity resolution to an external system (such as Active Directory), credentials are sent to this external system for resolution.

7. If the Domain is configured to use local membership, credentials are compared against the configured domain members (see 10.4).

8. The resolved principle (user, group, indication of validity) is returned for further use.

9. If the CDMI server supports ACLs (see 17.2.1), the CDMI server evaluates the object ACL. If the CDMI system does not support ACLs, steps 9 - 15 are skipped.

10. The CDMI ACL processing subsystem obtains the ACL for the object.

11. The CDMI server obtains ACL metadata associated with the object.

12. If the object is in a container, the CDMI server obtains ACL metadata for parent containers.

13. The obtained ACL metadata is returned for further use.

14. The CDMI ACL processing subsystem evaluates the resolved principals against the resolved ACL.

15. The evaluated permission mask is returned for further use.

16. If the CDMI server supports Delegated Access Control (DAC) (see clause 24), the CDMI server obtains DAC metadata associated with the object the CDMI operation is being performed against. If the CDMI system does not support DAC, steps 16 - 22 are skipped.

17. The CDMI server obtains DAC metadata associated with the object.

18. DAC metadata is returned for further use.

19. If DAC metadata is present and indicates that DAC is to be used, the specified delegation is performed.

20. The external DAC provider is contacted, including the evaluated Object permission mask.

21. If a valid DAC response is received, the dac_applied_mask replaces the evaluated Object permission mask.

22. The DAC results and Object permission mask is returned for further use.

23. The Object permission mask is used to determine if the requested operation is permitted.

24. The operation is permitted or denied, and the corresponding response returned to the CDMI Client.

Steps 2 - 8, 9 - 15, and 16 - 18 may be performed in parallel.

**17.2.1 General mechanisms**

CDMI uses the well-known mechanism of an Access Control List (ACL) as defined in the NFSv4 standard (see RFC 3530 [1]). ACLs are lists of permissions-granting or permissions-denying entries called Access Control Entries (ACEs).
Fig. 11: Access control flow
17.2.2 ACL and ACE structure

An ACL is an ordered list of ACEs. The two types of ACEs in CDMI are ALLOW and DENY. An ALLOW ACE grants some form of access to a principal. Principals are either users or groups and are represented by identifiers. A DENY ACE denies access of some kind to a principal. For instance, a DENY ACE may deny the ability to write the metadata or ACL of an object but may remain silent on other forms of access. In that case, if another ACE ALLOWs write access to the object, the principal is allowed to write the object’s data, but nothing else.

ACEs are composed of four fields: type, who, flags and access_mask, as per RFC 3530 [1]. The type, flags, and access_mask shall be specified as either unsigned integers in hex string representation or as a comma-delimited list of bit mask string form values taken from ACE types, ACE flags, and ACE masks bits.

17.2.3 ACE types

Table 144 defines the following ACE types, as specified in section 5.11.1 of RFC 3530 [1].

<table>
<thead>
<tr>
<th>String form</th>
<th>Description</th>
<th>Constant</th>
<th>Bit mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;ALLOW&quot;</td>
<td>Allow access rights for a principal</td>
<td>&quot;CDMI_ACE_ACCESS_ALLOW&quot;</td>
<td>0x00000000</td>
</tr>
<tr>
<td>&quot;DENY&quot;</td>
<td>Deny access rights for a principal</td>
<td>&quot;CDMI_ACE_ACCESS_DENY&quot;</td>
<td>0x00000001</td>
</tr>
<tr>
<td>&quot;AUDIT&quot;</td>
<td>Generate an audit record when the principal attempts to exercise the specified access rights</td>
<td>&quot;CDMI_ACE_SYSTEM_AUDIT&quot;</td>
<td>0x00000002</td>
</tr>
</tbody>
</table>

The reason that the string forms may be safely abbreviated is that they are local to the ACE structure type, as opposed to constants, which are relatively global in scope.

The client is responsible for ordering the ACEs in an ACL. The server shall not enforce any ordering and shall store and evaluate the ACEs in the order given by the client.

17.2.4 ACE who

The special "who" identifiers need to be understood universally, rather than in the context of a particular external security domain (see Who identifiers). Some of these identifiers may not be understood when a CDMI client accesses the server, but they may have meaning when a local process accesses the file. The ability to display and modify these permissions is permitted over CDMI, even if none of the access methods on the server understands the identifiers.

<table>
<thead>
<tr>
<th>Who</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;OWNER@&quot;</td>
<td>The owner of the file</td>
</tr>
<tr>
<td>&quot;GROUP@&quot;</td>
<td>The group associated with the file</td>
</tr>
<tr>
<td>&quot;EVERYONE@&quot;</td>
<td>The world</td>
</tr>
<tr>
<td>&quot;ANONYMOUS@&quot;</td>
<td>Access without authentication</td>
</tr>
<tr>
<td>&quot;AUTHENTICATED@&quot;</td>
<td>Any authenticated user (opposite of &quot;ANONYMOUS@&quot;)</td>
</tr>
<tr>
<td>&quot;ADMINISTRATOR@&quot;</td>
<td>A user with administrative status, e.g., &quot;root&quot;</td>
</tr>
<tr>
<td>&quot;ADMINUSERS@&quot;</td>
<td>A group whose members are given administrative status</td>
</tr>
</tbody>
</table>

To avoid name conflicts, these special identifiers are distinguished by an appended "@" (with no domain name).

17.2.5 ACE flags

CDMI allows for nested containers and mandates that objects and subcontainers be able to inherit access permissions from their parent containers. However, it is not enough to simply inherit all permissions from the parent; it might be desirable, for example, to have different default permissions on child objects and subcontainers of a given container. The flags in Table 146 govern this behavior.
<table>
<thead>
<tr>
<th>String form</th>
<th>Description</th>
<th>Constant</th>
<th>Bit mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;NO_FLAGS&quot;</td>
<td>No flags are set</td>
<td>&quot;CDMI_ACE_FLAGS_NONE&quot;</td>
<td>0x00000000</td>
</tr>
<tr>
<td>&quot;OBJECT_INHERIT&quot;</td>
<td>An ACE on which &quot;OBJECT_INHERIT&quot; is set is inherited by objects as an effective ACE: &quot;OBJECT_INHERIT&quot; is cleared on the child object. When the ACE is inherited by a container, &quot;OBJECT_INHERIT&quot; is retained for the purpose of inheritance, and additionally, &quot;INHERIT_ONLY&quot; is set.</td>
<td>&quot;CDMI_ACE_FLAGS_OBJECT_INHERIT_ACE&quot;</td>
<td>0x00000001</td>
</tr>
<tr>
<td>&quot;CONTAINER_INHERIT&quot;</td>
<td>An ACE on which &quot;CONTAINER_INHERIT&quot; is set is inherited by a subcontainer as an effective ACE. Both &quot;INHERIT_ONLY&quot; and &quot;CONTAINER_INHERIT&quot; are cleared on the child container.</td>
<td>&quot;CDMI_ACE_FLAGS_CONTainer_INHERIT_ACE&quot;</td>
<td>0x00000002</td>
</tr>
<tr>
<td>&quot;NO_PROPAGATE&quot;</td>
<td>An ACE on which &quot;NO_PROPAGATE&quot; is set is not inherited by any objects or subcontainers. It applies only to the container on which it is set.</td>
<td>&quot;CDMI_ACE_FLAGS_NO_PROPAGATE_ACE&quot;</td>
<td>0x00000004</td>
</tr>
<tr>
<td>&quot;INHERIT_ONLY&quot;</td>
<td>An ACE on which &quot;INHERIT_ONLY&quot; is set is propagated to children during ACL inheritance as specified by &quot;OBJECT_INHERIT&quot; and &quot;CONTAINER_INHERIT&quot;. The ACE is ignored when evaluating access to the container on which it is set and is always ignored when set on objects.</td>
<td>&quot;CDMI_ACE_FLAGS_INHERIT_ONLY_ACE&quot;</td>
<td>0x00000008</td>
</tr>
<tr>
<td>&quot;IDENTIFIER_GROUP&quot;</td>
<td>An ACE on which &quot;IDENTIFIER_GROUP&quot; is set indicates that the &quot;who&quot; refers to a group identifier.</td>
<td>&quot;CDMI_ACE_FLAGS_IDENTIFIER_GROUP&quot;</td>
<td>0x00000040</td>
</tr>
<tr>
<td>&quot;INHERITED&quot;</td>
<td>An ACE on which &quot;INHERITED&quot; is set indicates that this ACE is inherited from a parent directory. A server that supports automatic inheritance will place this flag on any ACEs inherited from the parent directory when creating a new object.</td>
<td>&quot;CDMI_ACE_FLAGS_INHERITED_ACE&quot;</td>
<td>0x00000080</td>
</tr>
</tbody>
</table>

**17.2.6 ACE mask bits**

The mask field of an ACE contains a 32 bit mask, as specified in section 5.11.2 of RFC 3530 [1]. Table 146 defines the impact of each bit in an ACE mask field.
Table 147: ACE masks bits

</tr>
</tbody>
</table>

Implementations shall use the correct string form to display permissions, if the object type is known. If the object type is unknown, the "object" version of the string shall be used.

### 17.2.7 ACL evaluation

When evaluating whether access to a particular object \( O \) by a principal \( P \) is to be granted, the server shall traverse the object’s logical ACL (its ACL after processing inheritance from parent containers) in list order, using a temporary permissions bitmask \( m \), initially empty (all zeroes), and apply the following algorithm:

- If the object still does not contain an ACL, the algorithm terminates and access is denied for all users and groups. This condition is not expected, as CDMI implementations should require an inheritable default ACL on all root containers.
- ACEs that do not refer to the principal \( P \) requesting the operation are ignored.
- If an ACE is encountered that denies access to \( P \) for any of the requested mask bits, access is denied and the algorithm terminates.
- If an ACE is encountered that allows access to \( P \), the permissions mask \( m \) for the operation is XORed with the permissions mask from the ACE. If \( m \) is sufficient for the operation, access is granted and the algorithm terminates.
- If the end of the ACL list is reached and permission has neither been granted nor explicitly denied, access is denied and the algorithm terminates, unless the object is a container root. In this case, the server shall:
  - allow access to the container owner, "ADMINISTRATOR@", and any member of "ADMINUSERS@"; and
  - log an event indicating what has happened.

When permission for the desired access is not explicitly given, even "ADMINISTRATOR@" and equivalents are denied for objects that aren’t container roots. When an admin needs to access an object in such an instance, the root container shall be accessed and its inheritable ACEs changed in a way as to allow access to the original object. The resulting log entry then provides an audit trail for the access.

When a root container is created and no ACL is supplied, the server shall place an ACL containing the following ACEs on the container:

```
"cdmi_acl":
{
    "acetype": "ALLOW",
    "identifier": "OWNER@",
    "aceflags": "OBJECT_INHERIT, CONTAINER_INHERIT",
    "acemask": "ALL_PERMS"
},
{
    "acetype": "ALLOW",
    "identifier": "AUTHENTICATED@",
    "aceflags": "OBJECT_INHERIT, CONTAINER_INHERIT",
    "acemask": "READ"
}
```

As ACLs are storage system metadata, they are stored and retrieved through the metadata field included in a PUT or GET request. The syntax is as follows, using the constant strings from ACE types, ACE flags, and ACE masks bits:

```
ACL = { ACE [, ACE ...] }
ACE = { acetype , identifier , aceflags , acemask }
acetype = uint_t | acetypeitem
```

---

1 The value fields, children fields, and metadata field are considered to be non-attribute fields. All other fields are considered to be attribute fields.
When ACE masks are presented in numeric format, they shall, at all times, be specified in hexadecimal notation with a leading "0x". This format allows both servers and clients to quickly determine which of the two forms of a given constant is being used. When masks are presented in string format, they shall be converted to numeric format and then evaluated using standard bitwise operators.

When an object is created, no ACL is supplied, and an ACL is not inherited from the parent container (or there is no parent container), the server shall place an ACL containing the following ACEs on the object:

```
"cdmi_acl":
  [
    {
      "acetype": "ALLOW",
      "identifier": "OWNER@",
      "aceflags": "OBJECT_INHERIT, CONTAINER_INHERIT",
      "acemask": "ALL_PERMS"
    }
  ]
```

### 17.2.8 Example ACE mask expressions

**Example 1:**

```
"READ_ALL" | 0x02
```

evaluates to 0x09 | 0x02 == 0x0

**Example 2:**

```
0x001F07FF
```
evaluates to $0x001F07FF == \"ALL\_PERMS\"

**Example 3:**

```
\"RW\_ALL\" | DELETE
```

evaluates to $0x0006006F | 0x00100000 == 0x000701DF

### 17.2.9 Canonical format for ACE hexadecimal quantities

ACE mask expressions may be evaluated and converted to a string hexadecimal value before transmission in a CDMI JSON body. Applications or utilities that display them to users should convert them into a text expression before display and accept user input in text format as well.

The following technique should be used to decompose masks into strings. A table of masks and string equivalents should be maintained and ordered from greatest to least:

<table>
<thead>
<tr>
<th>Hex form</th>
<th>Object string form</th>
<th>Container string form</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x001F07FF</td>
<td>&quot;ALL_PERMS&quot;</td>
<td>&quot;ALL_PERMS&quot;</td>
</tr>
<tr>
<td>0x0006006F</td>
<td>&quot;RW_ALL&quot;</td>
<td>&quot;RW_ALL&quot;</td>
</tr>
<tr>
<td>0x0000001F</td>
<td>&quot;RW&quot;</td>
<td>&quot;RW&quot;</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>0x00000002</td>
<td>&quot;WRITE_OBJECT&quot;</td>
<td>&quot;ADD_OBJECT&quot;</td>
</tr>
<tr>
<td>0x00000001</td>
<td>&quot;READ_OBJECT&quot;</td>
<td>&quot;LIST_CONTAINER&quot;</td>
</tr>
</tbody>
</table>

Given an access mask M, the following is repeated until M == 0:

1. Select the highest mask m from the table such that M & m == m.
2. If the object is a container, select the string from the 3rd column; otherwise, select the string from the 2nd column.
3. Bitwise subtract m from M, i.e., set M = M xor m.
4. The complete textual representation is then all the selected strings concatenated with ",\" between them, e.g., \"\"ALL\_PERMS, WRITE\_OWNER\"\". The strings should appear in the order they are selected.

A similar technique should be used for all other sets of hex/string equivalents.

This algorithm, properly coded, requires only one (often partial) pass through the corresponding string equivalents table.

### 17.2.10 JSON format for ACLs

ACE flags and masks are members of a 32-bit quantity that is widely understood in its hexadecimal representations. The JSON data format does not support hexadecimal integers, however. For this reason, all hexadecimal integers in CDMI ACLs shall be represented as quoted strings containing a leading \"0x\".

ACLs containing one or more ACEs shall be represented in JSON as follows:

```json
{
  "cdmi_acl" : [
    {
      "acetype" : "0xnn",
      "identifier" : "<user-or-group-name>",
      "aceflags" : "0xnn",
      "acemask" : "0xnn"
    },
    {
      "acetype" : "0xnn",
      "identifier" : "<user-or-group-name>",
      "aceflags" : "0xnn",
      "acemask" : "0xnn"
    }
  ]
}
```
ACEs in such an ACL shall be evaluated in order as they appear.

EXAMPLE 1: An example of an ACL embedded in a response to a GET request is as follows:

HTTP/1.1 200 OK
Content-Type: application/cdmi-object

{
  "objectType": "/application/cdmi-object",
  "objectId": "00007ED9001086A99CC6487FEE373D82",
  "objectName": "MyDataItem.txt",
  "parentURI": "/MyContainer/",
  "domainURI": "/cdmi_domains/MyDomain/",
  "capabilitiesURI": "/cdmi_capabilities/dataobject/",
  "completionStatus": "Complete",
  "mimetype": "text/plain",
  "metadata": {
    "cdmi_size": "17",
    "cdmi_acl": [
      {
        "acetype": "0x00",
        "identifier": "EVERYONE@",
        "aceflags": "0x00",
        "acemask": "0x00020089"
      }
    ],
    "valuerrange": "0-16",
    "value": "Hello CDMI World!"
  }
}
Clause 18

Retention and hold management

18.1 Overview

A cloud storage system may optionally implement retention management disciplines into the system management functionality of the cloud-based storage system. The implementation of retention and hold capabilities is indicated by the presence of the cloud storage system-wide capabilities for retention and hold capabilities.

Retention management includes implementing a retention policy, defining a hold policy to enable objects to be held for specific purposes (e.g., litigation), and defining how the rules for deleting objects are affected by placing either a retention policy and/or a hold on an object. CDMI™ object deletion is not a capability of retention management, per se, but rather is a general system capability. However, this clause describes what happens when placing either a retention policy and/or a hold on an object.

Retention management may be applied to the following object types:

- data objects,
- queue objects, and
- container objects.
18.2 Retention management disciplines

CDMI retention, deletion, and hold management affect any CDMI client that creates or deletes CDMI objects, as these disciplines mandate how a cloud storage system manages CDMI objects when they are created and until they are deleted.

CDMI retention management is comprised of three management disciplines: retention, hold, and deletion:

- CDMI retention uses retention time criteria to determine the time period during which object deletion from the CDMI-based system is prohibited. No changes to the object are allowed, even after the retention period has expired, except as specified below.

- CDMI hold prohibits object deletion and modification until all holds on the object have been released.

- A CDMI-based system shall not allow the deletion of a CDMI object before the CDMI retention time criteria are met or while holds exist. Any deletion attempts (e.g., by a CDMI application) shall return an error.

- After the CDMI retention time criteria have been met and all holds have been released, CDMI retention and holds shall no longer be a reason to prohibit object deletion.

- Once the retention period has started or if holds exist, changes to the object data and metadata shall not be allowed, with the exception of extensions to the retention and hold data system metadata. The retention data system metadata may be added or the retention period extended, and the hold data system metadata may be added or extended with additional holds. Any other attempt to modify the object shall return an error.
18.3 CDMI retention

18.3.1 Overview

CDMI retention only allows one retention policy to be applied to an object at a time.

Retention management uses time criteria to determine the time period during which CDMI object deletion from the CDMI-based system shall be prohibited. CDMI retention criteria shall be specified by the following data system metadata:

- a retention criteria identifier—a CDMI client-specified string that shall identify the retention records class (cdmi_retention_id); and
- a retention start time and retention period time—the start time, when used together with period, indicating when retention shall no longer be enforced (cdmi_retention_period).

When a CDMI client attempts to delete an object, the cloud storage system shall evaluate all such retention criteria and return an error, if any retention criteria have not been met.

When copying objects with a retention policy, retention properties shall not be transferred from the source CDMI object to the destination object, and the destination object shall not have a retention policy.

Fig. 12 shows how to establish time-based retention with a retention identifier. The value of the object data system metadata for the retention period shall not be reduced. Removing holds is outside the scope of the CDMI International Standard.

![Fig. 12: Object retention](image)

**Example:** Retention start date of 2010-04-28 with a duration of 730 days. No holds.

A specific HTTP error code (403) shall be returned on operations to objects that are under retention period when the cloud storage system attempts to change or delete the object before the retention period criteria are met.

A cloud storage system shall not prevent metadata changes that increase the retention period, as there are valid business reasons to change a retention period for an object.

18.3.2 Examples

EXAMPLE 1: Place an existing object under retention:

```bash
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=cdmi_retention_id&metadata=cdmi_retention_period HTTP/1.1
-->
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> 
--> {  
-->   "metadata": {  
-->     "cdmi_retention_id": "1",  
-->     "cdmi_retention_period": "2010-04-28T00:00:00.000000Z/2012-04-27T00:00:00.000000Z"  
-->   }  
--> }

<-- HTTP/1.1 204 No Content
```

EXAMPLE 2: Increase the duration of retention on an existing object under retention:
EXAMPLE 3: Decrease the duration of retention on an existing object under retention:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=cdmi_retention_period
   HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> 
-->   "metadata" : {
-->     "cdmi_retention_period" : "2011-04-28T00:00:00.000000Z/2012-01-27T00:00.000000Z"
-->   }
--> 
<-- HTTP/1.1 403 Forbidden
```
18.4 CDMI hold

18.4.1 Overview

CDMI hold enforces read-only data object access and prohibition of object deletion. A cloud storage system shall allow multiple holds to be applied to a single object to satisfy multiple hold orders. While an object is on hold, a cloud storage system shall strictly enforce read-only access to the object and prohibit object deletion.

When copying objects that are on hold, hold properties shall not be transferred from the source CDMI object to the destination object, and the destination object shall not be on hold.

Hold management uses a hold indicator to determine the time periods during which CDMI object revision (data and metadata) and deletion from the CDMI-based system shall be prohibited. CDMI hold criteria shall be specified by data system metadata, specifically, a hold criteria identifier that is a client-specified string that shall identify the holds and their order.

A CDMI client may place an object on hold by adding a hold identifier to the cdmi_hold_id data system metadata item. When an object is on hold, CDMI clients shall be subject to failures or unexpected state changes on operations, which would otherwise be successful if the object was not on hold.

Fig. 13 shows how placing a hold on an object affects its read-only and deletion capability.

Example: Hold placed on the object on 2012-01-01 and removed on 2013-01-01

Fig. 14 shows how to establish time-based retention with a retention identifier that has a hold placed on the object. The value of the object data system metadata for the retention period shall not be reduced, and the value of the object data system metadata for hold identifiers shall not permit holds to be removed. Removing holds is outside the scope of the CDMI International Standard.

Example: Start date of 2010-04-28 with a duration of 730 days; hold placed on the object

Fig. 15 shows how placing multiple holds on an object affects its read-only and deletion capability.
A cloud storage system shall maintain an on-hold object in read-only mode with respect to the application access to data and metadata and shall prohibit deletion, either automated or explicit.

- CDMI clients shall tolerate these object on-hold failures or state changes.
- Releases from hold are not part of this International Standard and are typically performed out of band using an additionally secured non-CDMI mechanism provided by the implementation.

A specific HTTP error code (403) shall be returned on operations to objects that are under a hold when the system attempts to change the object or attempts to delete the object before the hold is removed. This failure should be an error to the application.

### 18.4.2 Examples

**EXAMPLE 1: Place an existing object under hold:**

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=cdmi_hold_id HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
-->
--> { "metadata": {
-->   "cdmi_hold_id": {
-->     "case_7": ""
-->   }
--> }
--> }
<-- HTTP/1.1 204 No Content
```

**EXAMPLE 2: Attempt to remove a hold for an object under hold:**

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=cdmi_hold_id HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
-->
--> { "metadata": {
-->   "cdmi_hold_id": {}  
--> }
--> }
<-- HTTP/1.1 403 Forbidden
```

**EXAMPLE 3: Add a second hold to an object under hold:**
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=cdmi_hold_id HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
--> 
--> {  
-->   "metadata":{  
-->     "cdmi_hold_id": {  
-->       "case_7": "",  
-->       "case_15": ""  
-->     }  
-->   }  
--> }

<-- HTTP/1.1 204 No Content
18.5 CDMI auto-deletion

18.5.1 Overview

CDMI deletion controls cloud storage system actions with respect to object deletion. A cloud storage system may automatically delete a CDMI object after the retention time and hold criteria have been met. (See `cdmi_retention_autodelete` in `Data system metadata`.)

CDMI objects shall be automatically deleted by the system at the retention period expiration by setting the `cdmi_retention_autodelete` data system metadata item. The `cdmi_retention_autodelete` data system metadata item indicates to the system that the object shall be made unavailable for access after the retention criteria have been satisfied. The system shall ensure that the object is no longer available through the CDMI interface. If the system has satisfied the retention requirement and a hold is established for the object, the object shall not be made unavailable or deleted. When a hold and retention have been applied to an object, both need to be satisfied (retention period expired and no holds existing) for objects to be automatically deleted from the system.

**EXAMPLE 1:** Place an object under retention with autodelete:

```plaintext
--> PATCH /cdmi/2.0.0/MyContainer/MyDataObject.txt?metadata=cdmi_retention_period&--metadata=cdmi_retention_autodelete HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: application/cdmi-object
<--
-->  "metadata":{
-->    "cdmi_retention_period": "2011-04-28T00:00:00.000000Z/2013-04-27T00:00:00.000000Z",
-->    "cdmi_retention_autodelete": "true"
-->  }
 <-- HTTP/1.1 204 No Content
```
18.6 Retention security considerations

The accuracy and integrity of the retention start and elapsed times depend on the accuracy and integrity of the clock that is used to set their values. Equally important is the relative accuracy and security of the clock that determines if the retention period has elapsed when compared to the clock that sets the start time property. Relative time differences between these two clocks may lead to undesirable retention and deletion management behavior.

It is important to have a reliable source from which the system clock is set. A stratum 1 time is directly connected to a reference clock and is at the top of the time server hierarchy. Relative time differences between the system clock and the reference clock may lead to undesirable retention timestamps and difficulties with time action events.

EXAMPLE 1: An object is created in a cloud storage system at time 0 with a period of 8 years and autodelete of true. At time 1 year, the system clock is adjusted forward to 9 years. Now, because the system time is 9 years, the retention time criterion is satisfied, even though only 1 year has actually elapsed. And, since autodelete is true, the system automatically deletes the object.

The specification for accuracy and integrity of timekeeping is not within the scope of CDMI. However, to prevent undesirable retention and deletion management consequences, systems should maintain accurate clock time, with zero or minimal deviation to clock integrity.
Clause 19

Scope specification

19.1 Overview

CDMI™ provides a standardized mechanism to define sets of objects that match certain characteristics. This mechanism is known as a CDMI scope specification. Scope specifications are typically used to provide a CDMI client with a way to indicate in what set of CDMI objects it is interested.

Each JSON object within the scope specification represents a set of conditions that shall all be true in order for an object to be considered to match against the scope (a logical AND relationship). For queries, a matching object would be returned in the query results. An empty scope specification is considered to evaluate to true. Multiple JSON objects are used to express logical OR relationships, where if any JSON object in the scope evaluates to true, then the object shall be considered to have matched against the scope.

Each JSON object is constructed using the same structure that CDMI objects use. To show this structure, assume the following result from a GET for a data object:

```json
HTTP/1.1 200 OK
Content-Type: application/cdmi-object

{
  "objectType" : "application/cdmi-object",
  "objectID" : "00007E7F0010EB9092B29F6CD6AD6824",
  "objectName" : "MyDataObject.txt",
  "parentURI" : "/MyContainer/",
  "parentID" : "00007E7F00102E230ED82694DAA975D2",
  "domainURI" : "/cdmi_domains/MyDomain/",
  "capabilitiesURI" : "/cdmi_capabilities/dataobject/",
  "completionStatus" : "Complete",
  "mimetype" : "text/plain",
  "metadata" : {
    "cdmi_size" : "108263",
    ...
  },
  "valuerange" : "0-108262",
  "value" : "...
}
```
19.2 Examples

Each field inside a scope specification JSON object represents a condition that shall be met for a field.

EXAMPLE 1: A query to find all objects belonging to the domain "/cdmi_domains/MyDomain/" is structured as follows:

```json
[
  {
    "domainURI" : "== /cdmi_domains/MyDomain/"
  }
]
```

EXAMPLE 2: To query for all objects belonging to the domain "/cdmi_domains/MyDomain/" AND are also located within the container "MyContainer", the scope specification is structured as follows:

```json
[
  {
    "parentURI" : "== /MyContainer/",
    "domainURI" : "== /cdmi_domains/MyDomain/"
  }
]
```

EXAMPLE 3: To query for all objects created within a certain time range, the scope specification is structured as follows:

```json
[
  {
    "metadata": {
      "cdmi_ctime": [">2012-01-01T00:00:00", "<2013-01-01T00:00:00"
    ]
  }
]
```

When multiple matching expressions are specified for a given field or metadata item, all matching expression must evaluate true for an object to be considered a query result.

EXAMPLE 4: To query for all objects that belong to the domain "MyDomain" OR are located within the container "MyContainer", the query is structured as follows:

```json
[
  {
    "parentURI" : "== /MyContainer/",
  },
  {
    "domainURI" : "== /cdmi_domains/MyDomain/"
  }
]
```

Queries may match on any field within an object that a cloud storage system is capable of returning as a result of an object GET.

EXAMPLE 5: To query metadata items, the metadata object is included as an object within the query request. This query is shown as follows:

```json
[
  {
    "metadata" : {"colour" : "== blue"
  }
]
```

This approach allows matching against arbitrarily nested metadata structures. When a JSON object is included in the scope specification, matches are performed within that object, and when a JSON array is included in the scope specification, matches are performed within that array. Matching against the contents of arrays of objects is indicated by having an object within the array, as illustrated in Example 5.
EXAMPLE 6: To query all objects with an ACE associated with the user "jdoe":

```json
{
  "metadata": {
    "cdmi_aci": [
      { "identifier": "== jdoe"
    ]
  }
}
```

EXAMPLE 7: To query the value of objects, the value field is included within the query request. Values are always represented using base 64 encoding in queries.

```json
{
  [ { "value": "== Ymx1ZQ==" }
}
```

Query against the value of objects is optional and is indicated by the presence of the `cdmi_query_value` capability.
### 19.3 Query matching expressions

Query matching expressions are structured as "<operator>" or "<operator><sp><constant>“, and are defined in Table 149.

Table 149: Query matching expressions

<table>
<thead>
<tr>
<th>Matching Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;field&quot;: &quot;*&quot;</td>
<td>The exists matching expression tests for the existence of the field. If the field is present, even if empty, the condition shall be considered to be met.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;!*&quot;</td>
<td>The not exists matching expression tests for the non-existence of the field. If the field is absent, the condition shall be considered to be met.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;== constant&quot;</td>
<td>The equals matching expression tests for the equality of the value of the field and a specified constant value. The equality test is case sensitive. If the constant value matches the value of the field, the condition shall be considered to be met.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;#== constant&quot;</td>
<td>The numeric equals matching expression tests for the numeric equality of the value of the field and a specified constant value.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;!= constant&quot;</td>
<td>The not equals matching expression tests for the non-equality of the value of the field and a specified constant value. The not-equals test is case sensitive. If the constant value does not match the value of the field, the condition shall be considered to be met.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;#!= constant&quot;</td>
<td>The numeric not equals matching expression tests for non-equality of the numeric value of the field and a specified constant value.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;&gt; constant&quot;</td>
<td>The greater than matching expression tests if the value of the field is lexicographically greater than a specified constant value. The greater than test is case sensitive. If the constant value is greater than the value of the field, the condition shall be considered to be met.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;&gt;= constant&quot;</td>
<td>The numeric greater than matching expression tests if the numeric value of the field is greater than a specified constant value.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;&gt;= constant&quot;</td>
<td>The numeric greater than or equals to matching expression tests if the numeric value of the field is greater than or equal to a specified constant value.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;&lt; constant&quot;</td>
<td>The less than operator tests if the value of the field is lexicographically less than a specified constant value. The less than test is case sensitive. If the constant value is less than the value of the field, the condition shall be considered to be met.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;&lt;&lt; constant&quot;</td>
<td>The numeric less than operator tests if the numeric value of the field is less than a specified constant value.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;&lt;&lt; constant&quot;</td>
<td>The numeric less than or equals to matching expression tests if the numeric value of the field is less than or equal to a specified constant value.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;starts constant&quot;</td>
<td>The starts with matching expression tests if the field value starts with a specified constant value. If the constant value is equal to the start of the value of the field, the condition shall be considered to be met.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;!starts constant&quot;</td>
<td>The not starts with matching expression tests if the field value does not start with a specified constant value. If the constant value is not equal to the start of the value of the field, the condition shall be considered to be met.</td>
</tr>
<tr>
<td>&quot;field&quot;: &quot;ends constant&quot;</td>
<td>The ends with matching expression tests if the field value ends with a specified constant value. If the constant value is equal to the end of the value of the field, the condition shall be considered to be met.</td>
</tr>
</tbody>
</table>
### Table 149 – continued from previous page

<table>
<thead>
<tr>
<th>Matching Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;field&quot;:&quot;!ends constant&quot;</td>
<td>The not ends with matching expression tests if the field value does not end with a specified constant value. If the constant value is not equal to the end of the value of the field, the condition shall be considered to be met.</td>
</tr>
<tr>
<td>&quot;field&quot;:&quot;contains constant&quot;</td>
<td>The contains matching expression tests if the field value contains a specified constant value. If the constant value is found as a substring within the value of the field, the condition shall be considered to be met. The contains operator is only supported if the <code>cdmi_query_contains</code> capability is present.</td>
</tr>
<tr>
<td>&quot;field&quot;:&quot;!contains constant&quot;</td>
<td>The not contains matching expression tests if the field value does not contain a specified constant value. If the constant value is not found as a substring within the value of the field, the condition shall be considered to be met. The not contains operator is only supported if the <code>cdmi_query_contains</code> capability is present.</td>
</tr>
<tr>
<td>&quot;field&quot;:&quot;tag constant&quot;</td>
<td>The tag matching expression tests if the field value contains a specified constant tag value. The leading space character after the &quot;tag&quot; and before the constant value is not included in the comparison. The tag test is not case sensitive. If the constant value is found as a tag substring within the value of the field, the condition shall be considered to be met. Tag substrings start at the beginning of the value or a &quot;,&quot;, and end at the next &quot;,&quot; or the end of the string. Whitespace before and after &quot;,&quot; characters shall be stripped for the purpose of comparisons. Tag matching expressions are only supported if the <code>cdmi_query_tags</code> capability is present.</td>
</tr>
<tr>
<td>&quot;field&quot;:&quot;!tag constant&quot;</td>
<td>The not tag matching expression tests if the field value does not contain a specified constant tag value. The leading space character after the &quot;!tag&quot; and before the constant value is not included in the comparison. The not tag test is not case sensitive. If the constant value is not found as a tag substring within the value of the field, the condition shall be considered to be met. Tag substrings start at the beginning of the value or a &quot;,&quot;, and end at the next &quot;,&quot; or the end of the string. Whitespace before and after &quot;,&quot; characters shall be stripped for the purpose of comparisons. Tag matching expressions are only supported if the <code>cdmi_query_tags</code> capability is present.</td>
</tr>
<tr>
<td>&quot;field&quot;:&quot;=~ constant&quot;</td>
<td>The regular expression matching expression tests if the field value matches a specified constant regular expression value. If the regular expression evaluates to true against the value, the condition shall be considered to be met. Regular expression strings shall be processed according to the POSIX Extended Regular Expression (ERE) standard, as specified in IEEE 1003.1-2017 [41]. Regex matching expressions are only supported if the <code>cdmi_query_regex</code> capability is present.</td>
</tr>
<tr>
<td>&quot;field&quot;:&quot;!~ constant&quot;</td>
<td>The not regular expression matching expression tests if the field value does not match a specified constant regular expression value. If the regular expression evaluates to false against the value, the condition shall be considered to be met. Regular expression strings shall be processed according to the POSIX Extended Regular Expression (ERE) standard, as specified in IEEE 1003.1-2017 [41]. Regex matching expressions are only supported if the &quot;cdmi_query_regex&quot; capability is present.</td>
</tr>
</tbody>
</table>

3485 Numeric constant strings shall be processed according to the JSON number representation described in RFC 4627 [5].
3486 A numeric matching expression shall be considered to be non-matching against a non-numeric field value.
3487 All fields in objects that are not included in the scope specification shall be ignored for the purpose of matching objects.
3488 When a URI is used as the constant for the equals and not equals operators against the `parentURI`, `domainURI`, and `capabilitiesURI`, either a URI by path or URI by object ID may be specified and are considered interchangeable.
19.3.1 Examples

EXAMPLE 1: In a query to find all objects belonging to a specific domain, the following two query scopes are considered identical:

```json
[
    {
        "domainURI" : "== /cdmi_domains/MyDomain/"
    }
]
```

and

```json
[
    {
        "domainURI" : "== /cdmi_objectid/00007E7F001074C86AD256DA5C67180D/"
    }
]
```

EXAMPLE 2: Likewise, a query to find all objects with a given parent container would have two equivalent forms:

```json
[
    {
        "parentURI" : "== /MyContainer/"
    }
]
```

and

```json
[
    {
        "parentURI" : "== /cdmi_objectid/00007ED900100E358C3B312DB652C201/"
    }
]
```

If an object ID is used in a query scope in the objectID field or the parentID field, all object IDs shall be processed such that they are case insensitive.
Clause 20

Results specification

20.1 Overview

CDMI™ provides a standardized mechanism to define subsets of object contents. This mechanism is known as a CDMI results specification. Results specifications are typically used to provide a CDMI client with a way to indicate on what subset of the contents of CDMI objects it intends to retrieve or operate.

Each JSON object within the results specification represents a set of fields that are returned for each matching object.

The results JSON object shall be constructed using the same structure as is used for CDMI objects. To show this, assume the following result from a GET for a data object:

```
HTTP/1.1 200 OK
Content-Type: application/cdmi-object

{
    "objectType": "application/cdmi-object",
    "objectID": "00007E7F0010EB9092B29F6CD6AD6824",
    "objectName": "MyDataObject.txt",
    "parentURI": "/MyContainer/",
    "parentID": "00007E7F00102E230ED82694DAA975D2",
    "domainURI": "/cdmi_domains/MyDomain/",
    "capabilitiesURI": "/cdmi_capabilities/dataobject/",
    "completionStatus": "Complete",
    "mimetype": "text/plain",
    "metadata": {
        "cdmi_size": "108263",
        ...
    },
    "valuerange": "0-108262",
    "value": "..."
}
```
20.2 Examples

Each field inside a results specification JSON object indicates that the field shall be included in the results.

EXAMPLE 1: The following results specification requests that the `objectID` and `cdmi_size` metadata fields be returned in the results:

```javascript
{
    "cdmi_results_specification": {
        "objectID": "",
        "metadata": {
            "cdmi_size": ""
        }
    }
}
```

EXAMPLE 2: If an object is matched, the result JSON is enqueued as follows:

```javascript
{
    "objectID": "00007E7F0010EB9092B29F6CD6AD6824",
    "metadata": {
        "cdmi_size": "108263"
    }
}
```

For most common use cases, clients request either the `objectID`, the `objectName` and `parentURI`, or all three fields in the `cdmi_results_specification`. If the `parentURI` or `objectName` is requested, the field shall only be returned for objects existing in a container object.

EXAMPLE 3: To request all metadata items be returned for each matching object, the following `cdmi_results_specification` shall be used:

```javascript
{
    "cdmi_results_specification": {
        "metadata": ""
    }
}
```

EXAMPLE 4: To request all fields and all metadata items be returned for each matching object, the following `cdmi_results_specification` shall be used:

```javascript
{
    "cdmi_results_specification": ""
}
```

The `value` field is always returned in base 64 encoding when included in a query result, where the `valuetransferencoding` field indicates the encoding that should be expected if a GET to read the object is performed.
Clause 21

Notification queues

21.1 Overview

A cloud storage system may optionally implement notification functionality. The implementation of notification is indicated by the presence of the cloud storage system-wide capabilities for notification, and requires support for CDMI™ queues. Notification queues allow CDMI clients to efficiently discover what changes have occurred to the system. As queue data is persistent, no session state needs to be retained by the client. If different notification queues are used for different clients, then each client operates independently from the others (e.g., a storage management application may use a notification queue to keep its database current without having to do full scans of a container to discover what data objects have been added, modified, or removed).

When a client wishes to receive notifications, it may first check if the system is capable of providing notifications by checking for the presence of the cdmi_notification capability in the root container capabilities. If this capability is not present, creating a notification queue shall be successful, but no notifications shall be enqueued into the notification queue.

To create a notification queue, the client creates a regular CDMI queue and adds metadata instructing the storage system to treat the queue as a notification queue. This added metadata also instructs the system about what types of notifications shall be generated and what information shall be included with each notification.

After the notification queue is created, all subsequent matching events after the queue creation time shall result in notification results being enqueued into the queue. CDMI does not mandate any specific ordering of events, and clients must be able to handle events that arrive out of order.
21.2 Metadata

21.2.1 Required metadata

When creating a notification queue, the metadata described in Table 150 shall be provided. Attempts to change metadata in this table shall result in an HTTP status code of 403 Forbidden. After a notification queue has been created, with the exception of cdmi_queue_type, the metadata items in this table may not be changed. cdmi_queue_type may only be removed, indicating to the system that the notification queue shall no longer receive notifications and shall be treated as a regular CDMI queue object.

Table 150: Required metadata for a notification queue

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_queue_type</td>
<td>JSON</td>
<td>Queue type indicates how the cloud storage system shall manage the queue object. The type of cdmi_notification_queue is defined for notification queues.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

<td>JSON object</td>
<td>The results specification contains the JSON fields to be returned for each object that matches the notification scope specification. See clause 20 for how to construct a results specification. In addition to the fields defined in clause 20, for notifications, four additional fields are defined: • cdmi_event - Indicates the event as specified in the &quot;cdmi_notification_events&quot; field that triggered the notification; • cdmi_event_result - Indicates the status result of the event that triggered the notification. The status is the same as the status that was returned over the HTTP request, i.e., 200 OK, 404 Not Found, etc.; • cdmi_event_time - Indicates the time of the event that triggered the notification. The time will be formatted in ISO-8601 time (see clause 5.6 and ISO 8601-1:2019); and • cdmi_event_user - Indicates the principal (ACL name) of the user that caused the event that triggered the notification. If the system triggered the event, the name will be left as an empty string.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

21.2.2 Examples

EXAMPLE 1: The metadata associated with a notification queue is as follows:

```
{
  "metadata": {
    "cdmi_queue_type": "cdmi_notification_queue",
    "cdmi_notification_events": [
      "cdmi_create_complete",
      "cdmi_read",
      "cdmi_modify_complete",
      "cdmi_delete"
    ],
    "cdmi_scope_specification": [
      {
        "domainURI": "== /cdmi_domains/MyDomain/",
        "parentURI": "starts /sandbox",
        "metadata": {
          "cdmi_size": ">+100000"
        }
      }
    ],
    "cdmi_results_specification": {
      "cdmi_event": "",
      "cdmi_event_result": "",
      "cdmi_event_time": "",
      "objectID": "",
      "metadata": {
        "cdmi_size": ""
      }
    }
  }
}
```

When notification results are stored in a notification queue, each enqueued value shall consist of a JSON object of MIME type "application/json". This JSON object contains the specified values requested in the cdmi_results_specification of the notification queue metadata.
EXAMPLE 2: A notification result JSON object is as follows:

```
{
    "cdmi_event" : "cdmi_read",
    "cdmi_event_result" : "200 OK",
    "cdmi_event_time" : "2010-11-15T13:12:52.342324Z",
    "objectID" : "00007E7F0010EB9092B29F6CD6AD6824",
    "metadata" : {
        "cdmi_size" : "108263"
    }
}
```

Objects shall only be included in the notification results if the user who created the notification queue is able to read the matching object.

If the administrator created the notification queue, then all matching objects that the administrator is allowed to read are included in the results. If user "jdoe" created the notification queue, then only matching objects that "jdoe" is allowed to read are included in the results.

### 21.2.3 System-created metadata

Table 151 describes the system-created metadata that provides details on the status of the notification queue.

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| cdmi_notification_status       | JSON string | A string indicating the state of the notification queue. Defined values are:  
• Processing - Indicates that the notification queue is scanning for results;  
• Halted - Indicates that new notifications will no longer be enqueued;  
• Current - Indicates that the notification queue contained all notifications that can be found at this time; and  
• Error - Indicates that the notification queue metadata is not valid, or other errors were encountered that prevented notification messages from being enqueued. Arbitrary vendor-defined text may follow the string "Error".  
If this metadata item does not exist, then notifications have not yet started being enqueued. | Mandatory   |
Clause 22

Query queues

22.1 Overview

A cloud storage system may optionally implement metadata and/or full-text query functionality. The implementation of query is indicated by the presence of the cloud storage system-wide capabilities for query and requires support for CDMI™ queues.

Query queues allow CDMI clients to efficiently discover what content matches a given set of metadata query criteria or full-content search criteria. Clients create or update a query queue by specifying metadata that defines the matching criteria (known as the query scope), along with what results should be returned for matching objects (known as the query results). The cloud service shall then perform the query using the content existing at the time the query is being processed, storing the query results in the query queue. As query results are found, they are added to the queue, and when the query is complete, the cdmi_query_status metadata of the queue is changed to indicate that the query has completed. Any matching objects created or modified while the query is being performed may or may not be included in the query results (e.g., as a consequence of eventual consistency).

When a client wishes to perform queries, it may first check if the system is capable of providing query functionality by checking for the presence of the cdmi_query capability in the root container capabilities. If this capability is not present, creating a query queue shall be successful, but no query results shall be enqueued into the query queue.

When creating a query queue, the metadata described in Table 152 shall be provided. Attempts to change metadata in this table shall result in an HTTP status code of 403 Forbidden. After a query queue has been created, with the exception of cdmi_queue_type, the metadata items in this table cannot be changed. If the value of cdmi_queue_type is changed from "cdmi_query_queue", this change indicates to the system that an in-process query shall be stopped, the query queue shall no longer receive query results, and the query queue shall be treated as a regular CDMI queue object. To start a new query with an existing queue, the value of the cdmi_queue_type shall be changed back to "cdmi_query_queue". This international standard does not define a mechanism to pause a running query or resume a stopped query.

Table 152: Required metadata for a query queue

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_queue_type</td>
<td>JSON string</td>
<td>The queue type indicates how the cloud storage system shall manage the queue object. The type of &quot;cdmi_query_queue&quot; is defined for query queues.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>cdmi_scope_specification</td>
<td>JSON array of JSON objects</td>
<td>The scope specification determines which objects are included in the query results. This scope specification is similar to a &quot;WHERE&quot; clause in SQL-like languages. To query all objects, specify an empty JSON array. See Clause 19 for how to construct a scope specification.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>cdmi_results_specification</td>
<td>JSON object</td>
<td>The results specification contains the JSON fields to be returned for each object that matches the query. This results specification is similar to a &quot;SELECT&quot; clause in SQL-like languages. See Clause 20 for how to construct a results specification.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
22.1.1 Examples

EXAMPLE 1: An example of the metadata associated with a query queue is as follows:

```json
{
    "metadata": {
        "cdmi_queue_type": "cdmi_query_queue",
        "cdmi_scope_specification": [{
            "domainURI": "== /cdmi_domains/MyDomain/",
            "parentURI": "starts /sandbox",
            "metadata": {
                "cdmi_size": "#> 100000"
            }
        }],
        "cdmi_results_specification": {
            "objectID": "",
            "metadata": {
                "cdmi_size": ""
            }
        }
    }
}
```

When results are stored in a query queue, each enqueued value shall consist of a JSON object of MIME type "application/json". This JSON object contains the specified values requested in the `cdmi_results_specification` of the query queue metadata.

EXAMPLE 2: An example of a query result JSON object is as follows:

```json
{
    "objectID": "00007E7F0010EB9092B29F6CD6AD6824",
    "metadata": {
        "cdmi_size": "108263"
    }
}
```

Table 153 describes the system-created metadata that provides details on the status of the query queue.

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_query_status</td>
<td>JSON</td>
<td>When present, this metadata item indicates the state of the query queue. Defined values are: Processing - Indicates that the query queue is scanning for results; Halted - Indicates that new query results will no longer be enqueued; Current - Indicates that the query queue contained all query results that can be found at this time; and Error - Indicates that the query queue metadata was not valid, or other errors were encountered that prevented all query results from being enqueued. Arbitrary vendor-defined text may follow the string &quot;Error&quot;.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Objects shall only be included in the query results if the user who created the query queue is able to read the matching objects or metadata.

**NOTE:** If the administrator created the query queue, then all matching objects that the administrator is allowed to read are included in the results. If user "jdoe" created the query queue, then only matching objects that "jdoe" is allowed to read are included in the results.
22.2 Extending CDMI query

An implementor of a CDMI server may extend CDMI query by adding vendor-specific matching expressions. When an implementor adds vendor-specific metadata fields, these fields shall be queried using the standard query queue functionality.

An implementor of a CDMI server may extend CDMI query by allowing the creation of vendor-specific query queues with a type other than "cdmi_query_queue".
Clause 23

Encrypted objects

23.1 Overview

A cloud storage system may optionally implement additional operations against encrypted objects. Support for these operations are indicated by the presence of the cloud storage system-wide capabilities for encrypted objects.

Encrypted object operations include the ability to encrypt, re-encrypt, and decrypt objects that are already stored in the cloud (in-place), to sign and verify the signature of encrypted objects, and to access and update the plaintext associated with encrypted objects.

The CDMI International Standard does not specify the method by which keys are managed. Key management services are provided by an external key management system (KMS), and the use of the KMIP standard is given as an example of how a CDMI server interacts with an external KMS.

CDMI objects may contain values that are encrypted. Operations against an encrypted CDMI object are only supported if the encrypted object value is a valid CMS or JWE JSON format. The CMS or JWE JSON object shall include an embedded mimetype of the encrypted object. For JWE, the “cty” header shall be used for this purpose.
23.2 Encryption operations

23.2.1 State diagram

The state transition diagram for encrypted objects is shown in Fig. 16:

The eight encryption operations are defined in Section 23.2.2 through Section 23.2.9.

23.2.2 Create a new encrypted object

Client-encrypted objects shall be stored to a CDMI server using a standard HTTP or CDMI PUT operation, as described in clauses 7.2 and 8.3. The client shall indicate that an object is encrypted by specifying a mimetype of "application/cms" or "application/jose+json".

A client may register an encryption key, signing keys and/or verification keys with a Key Management System (KMS), and may indicate the Key IDs in cdmi_enc_key_id, cdmi_enc_value_sign_id, cdmi_enc_object_sign_id, cdmi_enc_value_verify_id, and/or cdmi_enc_object_verify_id metadata items. This allows the CDMI server to access the keys from the KMS on behalf of a client, when needed.

Creating an encrypted objects on a CDMI server does not require any encryption-specific capabilities to be supported, and is backwards compatible with earlier versions of the CDMI standard. This permits encrypted objects to be stored...
and transferred by CDMI servers that do not support encryption-specific functionality.

### 23.2.3 Delete an encrypted object

Encrypted objects shall be deleted using a standard HTTP or CDMI DELETE operation, as described in clause 7.5 and clause 8.6. Any client with sufficient permissions shall be permitted to delete an encrypted object, regardless of if they can access the decryption keys.

### 23.2.4 Encrypt an unencrypted object

Existing unencrypted objects shall be encrypted in-place by performing a CDMI PATCH operation, as described in clause 8.5, that changes the object mimetype to "application/cms" or "application/jose+json" and specifies a cdmi_enc_key_id metadata item. The client may also specify a cdmi_enc_value_sign_id and/or cdmi_enc_value_verify_id metadata item to indicate that the object is to be signed, and to provide signature verification information.

The CDMI Server shall use the client's credentials (which are included in HTTP headers, and are out of scope of this International Standard) to retrieve the encryption and signing keys, and encryption and signing algorithm information from the KMS, and shall use the keys to encrypt and sign the value of the object. The mimetype of the encrypted value is stored in the CMS wrapper, or in a "cty" field of the JWE JSON.

### 23.2.5 Decrypt an encrypted object

Existing encrypted objects shall be decrypted in-place by performing a CDMI PATCH operation, as described in clause 8.5, that changes the object mimetype from "application/cms" or "application/jose+json" to the original mimetype as specified in the CMS wrapper, or in the "cty" field of the JWE JSON. Specifying any other fields or metadata shall return a "400 Bad Request" result code.

The CDMI Server shall use the client's credentials (which are included in HTTP headers, and are out of scope of this International Standard) to retrieve the encryption, signing and verification keys, and encryption, signing and verification algorithm information from the KMS, and shall use the keys to decrypt and verify the encrypted value and user metadata included in the object.

### 23.2.6 Re-encrypt an encrypted object

Existing encrypted objects shall be re-encrypted in-place by performing a CDMI PATCH operation, as described in clause 8.5, that retains the object mimetype of "application/cms" or "application/jose+json", or changes the object mimetype from "application/cms" to "application/jose+json", or vice-versa. The client shall also specify a new cdmi_enc_key_id, cdmi_enc_value_sign_id and/or cdmi_enc_value_verify_id metadata item to indicate the new key(s) to be used. Specifying any other fields or metadata shall return a 400 Bad Request result code.

The CDMI Server shall use the client's credentials (which are included in HTTP headers, and are out of scope of this International Standard) to retrieve both the original encryption and signing keys using the original metadata values, and the new encryption and signing keys using the new metadata values from the KMS, and shall use these keys to decrypt, verify, encrypt and sign the value of the object, as needed.

If an encrypted object does not have an existing cdmi_enc_key_id metadata item, does not have a "kid" header, and no keys are associated with the Object ID, the specified metadata shall be added to the object, and no re-encryption operation shall be performed.

### 23.2.7 Access ciphertext of an encrypted object

The ciphertext content of an encrypted object shall be read by performing an HTTP GET operation, as described in clause 6.3, with an Accept header value of "application/cms" or "application/jose+json", depending on the mimetype of the encrypted object.

The ciphertext content of an encrypted object shall also be read by performing a CDMI GET operation, as described in clause 8.4.
23.2.8 Access plaintext of an encrypted object

The plaintext value of an encrypted object shall be read by performing an HTTP GET operation, as described in clause 6.3, with an Accept header value other than "application/cms" or "application/jose+json", typically "*/*". Object plaintext cannot be transparently accessed using a CDMI GET.

The CDMI Server shall use the client's credentials (which are included in HTTP headers, and are out of scope of this International Standard) to retrieve the encryption, signing and verification keys, and encryption, signing and verification algorithm information from the KMS, and shall use the keys to decrypt and verify the encrypted value included in the object.

When an encrypted object is decrypted for access, the plaintext shall not be retained or cached by the CDMI server.

23.2.9 Update plaintext of an encrypted object

The plaintext value of an encrypted object shall be modified by performing an HTTP PATCH operation, as described in clause 6.4, with a Content-Type header value other than "application/cms" or "application/jose+json", typically "*/*", depending on the mimetype of the encrypted object. Object plaintext cannot be transparently modified using a CDMI GET.

The CDMI Server shall use the client's credentials (which are included in HTTP headers, and are out of scope of this International Standard) to retrieve the encryption, signing and verification keys, and encryption, signing and verification algorithm information from the KMS, and shall use the keys to decrypt and verify the encrypted value, update the value, and re-encrypt/re-sign the updated value.

When an encrypted object is decrypted for update, the plaintext shall not be retained or cached by the CDMI server.

23.2.10 Other CDMI operations

Other operations specified by this International Standard (such as copying, serializing, querying, etc.) treat an encrypted value the same way as a non-encrypted value.
23.3 Example uses of encrypted objects

Encrypted objects can be used with CDMI systems in the following ways:

- **Passthrough** – A client may store an encrypted object in any format in a CDMI server, with the ciphertext being accessible to the server and to other authorized clients. No access to the plaintext is provided. Passthrough use is compatible with all CDMI systems and is useful when the clients manage all security-related operations and want to protect against potentially untrustworthy clouds.

- **Server-side encryption and signing** – A client may instruct a CDMI server that supports encrypted object operations to take an existing CDMI object and encrypt or encrypt and sign it in place into CMS or JWE JSON representation, where the value of the object is persistently stored from that point on in an encrypted format. Server-side encryption and signing is useful when clients trust the CDMI server and want to increase object security without having to re-upload the data.

- **Server-side decryption** – A client may instruct a CDMI server that supports encrypted object operations to take an existing CDMI object and decrypt it in place from a CMS or JWE JSON representation, where the value of the object is persistently stored from that point on in a decrypted format. Server-side decryption is useful when a client trusts the CDMI server and wants to decrease object security without having to re-upload the data.

- **Client access decryption** – A CDMI server may automatically attempt to decrypt an encrypted object when accessed via HTTP. Client access decryption is useful to provide transparent access to authorized HTTP clients without requiring modifications to the HTTP clients.

- **Cloud access decryption** – A CDMI server may automatically decrypt encrypted objects when it has access to the decryption keys. Cloud access decryption is useful for cloud-resident data processing performed by the CDMI server, such as virus scanning, query, and analytics.

- **Signature verification** – A CDMI server can automatically verify signatures that are attached to encrypted objects that include a signature. Signature verification is useful for detecting corruption or alteration before delivering data to a client.
23.4 KMS integration

The encryption key is obtained from the KMS using a unique identifier that is stored in the `cdmi_enc_key_id` metadata item associated with the encrypted object. If this metadata item is not present, the CDMI object ID shall be used to locate the key.

When a client requests that an operation be performed that requires accessing the key for the object, the CDMI server evaluates the credentials provided by the client to determine if the client is authorized to perform the requested operation. If the operation is permitted, the CDMI server retrieves the key from the KMS to complete the requested operation. To retrieve the key, the client may be required to provide additional information in the HTTP request that the CDMI server can then use to authenticate to the KMS.

The CDMI International Standard does not specify the mechanism by which the CDMI server communicates with the KMS. In this International Standard, the KMIP protocol is used as an example. CMS and JWE strings for algorithms, key lengths, etc., need to be mapped to the strings used by the KMS (see KMIP clause 9.1.3.2.7).

All keys are created and managed externally to the CDMI server, typically by the client or a system operating on behalf of the client. As a consequence, the CDMI server requires read-only access to the KMS. The CDMI server shall not cache keys.
23.5 CMS format

Any valid CMS-formatted data may be stored to a CDMI server. However, encrypted object operations are only defined for the following subset of valid CMS-formatted data.

For encryption operations, the CDMI server shall support the following:
  • EnvelopedData
  • EncryptedContentInfo
dataEncryptionAlgorithm value listed in the cdmi_cms_encryption capability of that CDMI server

For signature operations, the CDMI server shall support the following:
  • AuthenticatedData
  • SignedData
digestAlgorithms value listed in the cdmi_cms_digest capability of that CDMI server
  • SignerInfo
  • signatureAlgorithm value listed in the cdmi_cms_signature capability of that CDMI server

The following CMS-formatted data may be ignored: recipientInfos
23.6 JOSE format

Any valid JWE-formatted data may be stored to a CDMI server. However, encrypted object operations are only defined for a small subset of valid JWE-formatted data.

For encryption operations, the CDMI server shall support the following:

- JWE with Direct Encryption (Symmetric Key from KMS)
- JWE with Key Encryption (Public Key from KMS)

For signature operations, the CDMI server shall support the following:

- JWS RSA (Private Key from KMS)
- JWS ECDSA (Private Key from KMS)
- JWS HMAC-SHA2 (Symmetric Key from KMS)

The following JOSE-formatted data may be ignored:

- Multiple recipients, and
- Multiple signatures.
23.7 Signature/digest verification

If a signature is present as part of the CMS or JWE JSON value, the CDMI server shall verify that the signature of the value is valid before allowing plaintext access or modification.

If a whole-object signature is present, the CDMI server shall verify that the signature contained in the cdmi_enc_signature metadata item is valid before allowing any read operations for the object. Write operations are permitted for an object with an invalid or unverifiable whole-object signature.

When present, a whole-object signature shall be attached as a "cdmi_enc_signature" metadata item in JWS compact format, with the second field (the JWS payload field) replaced with an empty string as described in Appendix F of RFC 7515 [17].

For signature creation and verification, payload field shall be computed using the following process:

1. Create a serialized representation of the CDMI object, as described in clause 15
2. Remove the following metadata items, if present:
   * cdmi_atime
   * cdmi_acount
   * cdmi_enc_signature
   * Any *_provided metadata items
3. Sort all JSON objects in the serialized CDMI object according to the following rules:
   * Within each JSON object, name/value pair entries shall be sorted lexicographically by name
   * Within each JSON array, the initial order shall be preserved
4. Remove all JSON whitespace
5. Base64 URL encode, according to the JWS RFC 7515 [17]
23.8 Error handling

If a decryption or signature validation operation is requested against a CDMI object containing an invalid CMS or JWE JSON representation, an HTTP status code of **500 Internal Error** shall be returned to the client.

If a decryption or signature validation operation is requested against a CDMI object containing a valid CMS or JWE JSON representation that uses an unsupported algorithm or feature, an HTTP status code of **501 Not Implemented** shall be returned to the client.

If a decryption or signature validation operation is requested against a CDMI object containing a valid CMS or JWE JSON representation, but the required keys are temporarily unavailable given the credentials presented, an HTTP status code of **408 Request Timeout** shall be returned to the client.

If a decryption or signature validation operation is requested against a CDMI object containing a valid CMS or JWE JSON representation, but the required keys are unavailable given the credentials presented, an HTTP status code of **401 Unauthorized** shall be returned to the client.

If a decryption or signature validation operation is requested against a CDMI object containing a valid CMS or JWE JSON representation, valid keys are available, and signature verification fails, an HTTP status code of **403 Forbidden** shall be returned to the client.
Clause 24

Delegated access control

24.1 Overview

CDMI access control is based around Access Control Lists (ACLs) that are stored as object metadata. When a client requests to perform an operation against a CDMI object, the CDMI server shall validate the client’s identity and credentials against the object ACL to determine if the operation is allowed. This request assumes that the CDMI server is trusted and capable of making these access control decisions. Fig. 17 illustrates an ACL-based access control request:

When an access control decision needs to be made by a third party (such as by the originating CDMI server in Fig. 17), access control is delegated. When `cdmi_dac_uri` and `cdmi_dac_certificate` object metadata is present, as specified in clause 16.2, Delegated Access Control (DAC) shall be used.
An example of an object with DAC metadata is shown below:

```json
{
    "objectType": "application/cdmi-object",
    "objectName": "MyObject.txt",
    "capabilitiesURI": "/cdmi_capabilities/dataobject/",
    "objectID": "0000000800182ADB37303732323136662D343564622D3462",
    "mimetype": "text/plain",
    "metadata": {
        "cdmi_size": "33",
        "cdmi_ctime": "2017-04-05T11:01:25",
        "cdmi_atime": "2017-04-05T11:44:28",
        "cdmi_dac_uri": "https://cloud.example.com/dac/",
        "cdmi_dac_certificate": {
            "kty": "EC",
            "x": "goqhRgM4hyEh1p-fD1oU5QAqdMXsBZTQ_0B-1gS26t",
            "y": "cd8RTm8uLTGblIzioAzv8dX1KM8c08c23eksJrDzT2Y",
            "crv": "P-256"
        }
    },
    "valueTransferEncoding": "utf-8",
    "valueRange": "33",
    "value": "This is an unencrypted text file."
}
```

The process by which objects are federated between systems is outside the scope of access control delegation and involves how objects are replicated, synchronized, mirrored, or migrated between CDMI servers. These processes are typically under the control of policies or external policy management systems. Federation is typically performed by third-party systems that use CDMI features including notification, serialization, and the preservation of globally unique object identifiers, which forms the basis for client-transparent interoperability.
24.2 Delegated access control (DAC)

A cloud storage system may implement support for DAC, which is indicated by the presence of the cdmi_dac system-wide capability.

DAC enables requests for operations against an object to be allowed or denied by a third-party DAC provider, in addition to ACL access control. When required by object metadata, DAC access control verification shall be performed after ACL evaluation, but before ACL enforcement, as the DAC provider may overrule local ACL evaluation results. When an encrypted object is accessed, the DAC provider may provide the decryption key. The decryption key enables access to encrypted objects, even if the CDMI server cannot access the keys directly.

Clients often have different degrees to which they trust the CDMI server with which they are interacting. Table 154 describes the four ways that DAC shall interact with stored objects.

|                                    | This mode of access requires DAC support.                                        |

The `cdmi_dac_uri` metadata item indicates where delegated access control requests shall be submitted, and the `cdmi_dac_certificate` metadata item indicates how securely communication with the delegated access control provider shall be established. Both of these metadata items shall be present for DAC to be enabled for a given object.

DAC requests are submitted to a DAC provider using two typical methods:

- **Direct** - The DAC request shall be submitted directly to the absolute URI specified in the `cdmi_dac_uri` metadata item. This approach requires the host specified in the URI to be accessible from the CDMI server, and for the CDMI server making the request to have sufficient permissions to PUT the DAC request to that location.

- **Indirect** - The DAC request shall be sent to the DAC provider using an indirect route. Indirect routing is useful when the `cdmi_dac_uri` does not specify a host. An example of indirect routing is when the `cdmi_dac_uri` contains a mailto URI; the Internet mail system is then responsible for delivering the DAC request.

In other cases, the certificate included with the DAC request (taken from the `cdmi_dac_certificate` metadata) may be used by intermediary CDMI servers to determine the further routing of the DAC request. For example, DAC requests using a E.U.-issued certificate can be forwarded to a different intermediary CDMI server to those requests using a U.S.-issued certificate. How certificate fields are used to determine routing is not defined in this International Standard.

Both direct and indirect routing may be synchronous or asynchronous. If a DAC response is not received within the CDMI server or client timeout windows, the client request may time out; however a subsequent request may be processed locally if the DAC response allows response caching. When the CDMI server times out while waiting for a DAC response, it shall return an HTTP status code of 504 Gateway Timeout.
### 24.3 Delegated access control message exchange

When a client requests to access or modify an object containing DAC metadata on a CDMI server that supports DAC, the CDMI server shall create and send a DAC request as specified in clause 24.5. Upon receiving a DAC response as specified in clause 24.7, the CDMI server shall allow or deny the operation based on the contents of the response.

Fig. 18 provides an example of access control delegation for a non-encrypted object. The black solid lines show indirect routing, and gray dashed lines show direct routing.

For non-encrypted objects, an originating client indicates that DAC is requested by including the DAC metadata items. It is important to emphasize that for non-encrypted objects, DAC cannot be guaranteed to be enforced, as when an object with DAC metadata is accessed from a CDMI server that does not support DAC; only ACL-based access control shall be evaluated.
Fig. 19 provides a second example of access control delegation for an encrypted object. The black solid lines show indirect routing, and gray dashed lines show direct routing.

For encrypted objects, as access to the decryption keys are provided in the DAC response, the plaintext is inaccessible unless the CDMI server supports DAC.

When the DAC provider processes the DAC request, if the operation is allowed and the key is requested by the CDMI server, the object key, if present, shall be obtained and sent back as part of the DAC response. Upon receiving the DAC response, the CDMI server shall extract the key to perform the client operation.
24.4 Client header passthrough

The Delegated Access Control extension provides facilities to allow client-provided HTTP request headers to be passed through to the DAC provider, and for the DAC provider to pass HTTP response headers back to the client. These headers are identified by the "CDMI-DAC-" prefix.

The contents and full names of these headers are not defined in this International Standard. However, it is anticipated that these headers shall be used to allow the client to provide additional information that may be required for the access control decision-making process, for audit purposes, or for secure key exchange.

For example, when an operation is allowed by a DAC provider, the object key may be encrypted using the public key from a client-provided certificate (verified by the DAC provider), which is included in a "CDMI-DAC-" request header, with the encrypted object key being sent back to the client in a "CDMI-DAC-" response header. In this scenario, the CDMI server cannot decrypt the ciphertext but can securely pass on the encrypted object key to the client. The client can then use its private key to decrypt the response header to get the object key, which can then be used to decrypt the object.
24.5 DAC request

When a CDMI server that supports DAC needs to contact the DAC provider as specified in the DAC metadata, it shall construct a DAC request, as specified in Table 155.

Table 155: DAC request

<table>
<thead>
<tr>
<th>Field name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>dac_request_version</td>
<td>JSON string</td>
<td>Indicates the version of the DAC request. This field shall be set to the value &quot;1&quot;.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>dac_request_id</td>
<td>JSON string</td>
<td>Contains a system-specified identifier that is used to match up the corresponding DAC response. This identifier shall be unique within the window that multiple DAC responses may be received.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>server_identity</td>
<td>JSON object</td>
<td>A JSON object, containing a JWE JWK which shall include a public key that is used to submit a DAC response, and should contains a X.509 certificate or certificate chain used to verify the identity of the CDMI server that is generating the DAC request. This ensures that only the CDMI Server that generated the DAC request can read the DAC response.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>client_identity</td>
<td>JSON object</td>
<td>A JSON object containing the following JSON entities:</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· JSON String, &quot;acl_name&quot;, containing the ACL name of the client requesting the operation.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>· JSON Array, &quot;acl_group&quot;, containing the ACL group(s) of the client requesting the operation.</td>
<td></td>
</tr>
<tr>
<td>acl_effective_mask</td>
<td>JSON string</td>
<td>A text or hexadecimal string representation of the ACE mask determined by ACL evaluation for the requested operation, as defined in 17.2.6.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>client_headers</td>
<td>JSON object</td>
<td>A JSON object containing a JSON string for each HTTP header in the operation request that starts with &quot;CDMI-DAC-&quot;, where the JSON string name is the header name, and the JSON string value is the header value. These headers can be used for tunneling information from the client to the DAC provider.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>cdmi_objectID</td>
<td>JSON string</td>
<td>Contains the object ID of the object the operation is performed against.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>cdmi_enc_key_id</td>
<td>JSON string</td>
<td>Contains the encryption key identifier (for example, a KMIP identifier) for the symmetric key that is used to encrypt and decrypt the object, which is used to indicate that the CDMI server is requesting the encryption key.</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_operation</td>
<td>JSON string</td>
<td>Contains a string indicating which operation is being requested to be performed against the object. The following operations are defined:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· &quot;cdmi_read&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>· &quot;cdmi_modify&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>· &quot;cdmi_delete&quot;</td>
<td></td>
</tr>
<tr>
<td>dac_response_uri</td>
<td>JSON string</td>
<td>An optional URI that specifies where to send the DAC response. This URI is required for asynchronous DAC requests, such as when sent via email URIs. If this field is omitted, the DAC response shall be based on the context of the request, for example, as a message body returned for the request PUT when using HTTPS, or an email reply when using a mailto URI.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
An example of a DAC request is shown below:

```json
{
  "dac_request_version": "1",
  "dac_request_id": "037130fa-da72-44f0-8a31-62073263ac95",
  "server_identity": {

    "crv": "P-256"
  },
  "client_identity": {
    "acl_name": "anonymous",
    "acl_group": ["users"]
  },
  "acl_effective_mask": "READ_ALL",
  "client_headers": {
    "cdmi-dac-header1": "This is a test header"
  },
  "cdmi_objectID": "0000000800182ADB37303732323136662D343564622D3462",
  "cdmi_operation": "cdmi_read"
}
```
24.6 Packaged DAC request

A JSON DAC request shall be encrypted in JWE format, where the recipient is the public key of the DAC provider certificate (as specified in the DAC object cdmi_dac_certificate metadata), and is JWS signed using the private key of the CDMI server that corresponds to the server identity certificate included in the DAC request. The certificate of the DAC provider from the object is then attached as specified in Table 156.

Table 156: Packaged DAC request

<table>
<thead>
<tr>

    "crv": "P-256"
  },
  "dac_request_dest_uri": "https://cloud.com/dac"
}
```

Once created, the packaged DAC request shall be submitted using the DAC request URI specified in the DAC object.

1 Decrypt with ":NnUD0IeyV4JSyoLoKzIsXNLFAxhvdV6qqwAH1PkpWBMSY".
ject metadata, for example, as an HTTP PUT operation of type "application/json", or via an SMTP email. The `dac_request_dest_certificate` and `dac_request_dest_uri` may be used to route the request through intermediary hops, as needed.
### 24.7 DAC response

When a DAC provider receives a DAC request, it shall decrypt the request using its private key, verify the signature of the CDMI server, and shall evaluate the request. Based on the information provided, the DAC provider shall allow or deny operations by modifying or replacing the ACL mask that was initially determined by the CDMI server.

To indicate the result of the DAC request to the requesting CDMI server, the DAC provider shall construct a DAC response, as specified in Table 157.

<table>
<thead>
<tr>
<th>Field name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>dac_response_version</td>
<td>JSON string</td>
<td>Indicates the version of the DAC response. This field shall be set to the value &quot;1&quot;.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>dac_response_id</td>
<td>JSON string</td>
<td>Contains the system-specified identifier specified in the corresponding dac_request_id.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>dac_applied_mask</td>
<td>JSON string</td>
<td>A text or hexadecimal string representation of the ACE mask that shall be used, as defined in 17.2.6.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>dac_object_key</td>
<td>JSON object</td>
<td>The key for the object in JWK format (See RFC 7517 [16]). This key is only disclosed when cdmicrypt_key_id is included in the DAC request and the DAC provider allows access.</td>
<td>Optional</td>
</tr>
<tr>
<td>dac_response_headers</td>
<td>JSON object</td>
<td>A series of headers that start with &quot;CDMI-DAC-&quot; to be returned to the client. These headers can be used to pass information from the DAC provider back to the client.</td>
<td>Optional</td>
</tr>
<tr>
<td>dac_key_cache_expiry</td>
<td>JSON string</td>
<td>The complete date/time when the object key is no longer to be cached, specified in ISO 8601 date/time format. If this field is not included, the key shall not be cached.</td>
<td>Optional</td>
</tr>
<tr>
<td>dac_response_cache_expiry</td>
<td>JSON string</td>
<td>The complete date/time when the DAC response is no longer to be cached, specified in ISO 8601 date/time format. If this field is not included, the response shall not be cached.</td>
<td>Optional</td>
</tr>
<tr>
<td>dac_redirect_objectID</td>
<td>JSON string</td>
<td>Indicates an alternate CDMI Object ID used to access the requested object. If present, the CDMI server shall send an HTTP Redirect to the client.</td>
<td>Optional</td>
</tr>
<tr>
<td>dac_audit_uri</td>
<td>JSON string</td>
<td>Indicates a URI to a CDMI queue where audit logging messages associated with the operations shall be submitted. When present, audit logging messages shall be generated for receiving the response, performing the operation, and determining when to purge the key. The format of these audit messages is not defined by this International Standard.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

An example of a DAC response is shown below:

```json
{
  "dac_response_version": "1",
  "dac_response_id": "037130fa-da72-44f0-8a31-62073263ac95",
  "dac_applied_mask": "ALL_PERMS",
  "dac_response_headers": {
    "CDMI-DAC-AuthInfo": "No key requested."
  },
  "dac_response_cache_expiry": "2017-04-06T15:06:01.554Z"
}
```
24.8 Packaged DAC response

The above JSON (DAC response) shall be encrypted in JWE format where the recipient is the public key of the CDMI server certificate (as specified in the DAC request), and is JWS-signed using the private key of the DAC provider that corresponds to the DAC provider identity certificate associated with the object (cdmi_dac_certificate), or with a different signing, included in a jku/jwk/x5u or x5c JOSE header to allow retrieval of the public signing verification key.

The certificate of the CDMI server is then attached as specified in Table 158.

<table>
<thead>

  }
}
```

Once created, the packaged DAC response shall be returned as the response to the HTTPS/HTTP request, or submitted using the DAC response URI specified in the DAC request, for example, as an HTTP PUT operation or via an SMTP email. The dac_response_dest_certificate and dac_response_dest_uri may also be used to route the request through intermediary hops if needed, as determined by the routing system, which is out of scope of this standard.

When the CDMI server receives a packaged DAC response message, it shall decrypt it using its private key and shall verify the signature. If the decryption and signature verification are successful, the CDMI server shall use the provided dac_applied_mask in place of the ACL computed mask.

If the CDMI server supports key or DAC response caching, cache expiry values shall be honored. Cached responses and keys may only be used for identical client operations, where the client identity, objectID, operation, and “CDMI-2 Decrypt with “d”: “huCoV1iC24rZ3uF5q-1HHIGb2Unc6Us9oNezE0NzUB8”
DAC-* request headers are identical. Otherwise, the cached response shall be expired. If an audit URI is present in the cached response, audit messages shall also be generated for all operations allowed using the cached response.

The CDMI server shall also implement audit logging when specified in the DAC response. If the CDMI server does not support audit logging and it is required by a DAC response, the operation shall be denied.

If a dac_redirect_objectID field is returned in the DAC response, the CDMI server shall return an HTTP redirect to the specified Object ID. This redirect allows a DAC provider to create a client-operation-specific instance of the object that is encrypted with a single-use key.
### 24.9 Error handling

In the following scenarios, the following HTTP response codes shall be returned to a client:

- When a DAC response denies the requested operation, an HTTP status code of 403 Forbidden shall be returned to the client along with any `dac_response_headers` included in the response.

- When a DAC response includes a `dac_redirect_objectID`, an HTTP status code of 302 Found shall be returned to the client along with any `dac_response_headers` included in the response.

- When a DAC request to access or modify an encrypted object is allowed, but the key is not included in the DAC response, an HTTP status code of 401 Unauthorized shall be returned to the client along with any `dac_response_headers` included in the response.

- When a DAC request to access or modify an encrypted object is allowed, but cannot be performed due to lack of support for an encryption algorithm, signing algorithm, or key type, an HTTP status code of 501 Not Implemented shall be returned along with any `dac_response_headers` included in the response.

- When a DAC request times out, an HTTP status code of 500 Internal Server Error shall be returned to the client.

- When a DAC request cannot be sent or routed because the DAC metadata is not supported or valid, an HTTP status code of 501 Not Implemented shall be returned to the client.

- When a DAC request cannot be sent or routed because an upstream system is unavailable, an HTTP status code of 500 Internal Server Error shall be returned to the client.
24.10 Examples

The following examples illustrate the primary ways that DAC requests are performed.

EXAMPLE 1: GET ciphertext of encrypted object with delegated access control

The following CDMI operation is performed against an encrypted CDMI object with delegated access control metadata:

```plaintext
--> GET /MyContainer/MyEncryptedObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cms, application/jose+json

The CDMI server verifies local access controls and determines that the request can proceed. The following DAC request is generated:

```
{
  "dac_request_version": "1",
  "dac_request_id": "5b801b19-479e-446d-882a-8483f7c4905c",
  "server_identity": {
    "kty": "EC",
    "x": "joyfi05KEI3hcOhJe0fny_TWzS9FFS1zUydFQhmG78",
    "y": "Nsk3jX1ph0FH8APR2kOXSu6pDZYyP7f0Kp1f7h28k",
    "crv": "P-256"
  },
  "client_identity": {
    "acl_name": "anonymous",
    "acl_group": ["guest"]
  },
  "acl_effective_mask": "READ_ALL",
  "client_headers": {},
  "cdmi_objectID": "0000000800182F9E64313363323731622D363536662D3465",
  "cdmi_operation": "cdmi_read"
}
```

This request is first JWE encrypted with the key in cdmi_dac_certificate. The result is JWS signed, using either the key in server_identity, or a different key embedded in the JWS header.

The DAC provider verifies, decrypts and processes the request and returns the following DAC response:

```plaintext
{
  "dac_response_version": "1",
  "dac_response_id": "5b801b19-479e-446d-882a-8483f7c4905c",
  "dac_applied_mask": "ALL_PERMS",
  "dac_response_headers": {
    "CDMI-DAC-AuthInfo": "No key requested."
  }
}
```

The CDMI-DAC-AuthInfo indicates a custom header.

Since the operation is allowed by the DAC provider, the following response is sent:

```plaintext
<-- HTTP/1.1 200 OK
<-- Content-Type: application/jose+json
<-- Content-Length: 290
<-- CDMI-DAC-AuthInfo: No key requested.
<-- <JOSE+JSON Encrypted Object>
```

EXAMPLE 2: GET ciphertext of encrypted object with passthrough key access

The following CDMI operation is performed against an encrypted CDMI object with delegated access control metadata:

```plaintext
--> GET /cdmi/2.0.0/MyContainer/MyEncryptedObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Accept: application/cms, application/jose+json
--> Authorization: Basic am9lOnBhc3N3b3Jk
--> CDMI-DAC-N: <vendor-specific header that indicates key passthrough>
```

© SNIA 2020  SNIA Working Draft
The CDMI server verifies local access controls and determines that the request can proceed. The following DAC request is generated. The CDMI-DAC-N is a custom header that indicates that the client wants to obtain the object decryption key via header pass-through.

To demonstrate the power of such custom headers: the CDMI-DAC-N request header could contain a cell phone number. The matching response header would then contain a password-based encryption of the object key, while the password will be delivered via a message to the cell phone. It is up to the vendor to come up with and implement such mechanisms.

```
{
  "dac_request_version": "1",
  "dac_request_id": "77b54650-183f-4053-8512-be08f7c6c50e",
  "server_identity": {
    "kty": "EC",
    "x": "joyfi05KEI3hcOhJeOfrn_TWqZFSi20ydFQhm3G78",
    "y": "Nsk3jX1ph0FH&APR2k0X5u6pZrY7f_0kp1f7hE_6k",
    "crv": "P-256"
  },
  "client_identity": {
    "acl_name": "joe",
    "acl_group": ["users"]
  },
  "acl_effective_mask": "READ_ALL",
  "client_headers": {
    "CDMI-DAC-N": "<copy from headers>
  }
  "cdmi_objectID": "0000000800182F9E6431336332373162D363536662D3465",
  "cdmi_operation": "cdmi_read"
}
```

This request is first JWE encrypted with the key in cdmi_dac_certificate. The result is JWS signed, either using the key in server_identity, or a different key embedded in the JWS header. Replication of these encrypted messages is not useful and will be skipped.

The DAC provider processes the request, obtains the object decryption key and embeds it as a dac_response_header, then returns the following DAC response:

```
{
  "dac_response_version": "1",
  "dac_response_id": "5b801b19-479e-446d-882a-8483f7c4905c",
  "dac_applied_mask": "ALL_PERMS",
  "dac_response_headers": {
    "CDMI-DAC-AuthInfo": "Key successfully retrieved from keyserver."
    "CDMI-DAC-N": "<vendor-specific decryption key info>"
  }
}
```

Since the operation is allowed by the DAC provider, the following response is sent:

```
HTTP/1.1 200 OK
Content-Type: application/jose+json
Content-Length: 290
CDMI-DAC-AuthInfo: Key successfully retrieved from keyserver.
CDMI-DAC-N: <vendor-specific decryption key info>

<JOSE+JSON Encrypted Object>
```

The client can now parse the key in the CDMI-DAC-N header and use it to decrypt the ciphertext.

EXAMPLE 3: GET plaintext of encrypted object with delegated access control

The following CDMI operation is performed against an encrypted CDMI object with delegated access control metadata:

```
--> GET /cdmi/2.0.0/MyContainer/MyEncryptedObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Accept: */*
--> Authorization: Basic am9lOnBhc3N3b3Jk
```

The CDMI server verifies local access controls and determines that the request can proceed. The following DAC request is generated:
Cloud Data Management Interface 2.0.0a

```
{
  "dac_request_version": "1",
  "dac_request_id": "b79d7619-1bbd-45a1-b2d3-5753f7fc5155",
  "server_identity": {
    "kty": "EC",
    "x": "joyf105KEI13hcOhJe0fny7WwZ9FFS1zUydFqh3G78",
    "y": "Nsk3jX1ph0FH8APR2kX0XSU6pD2Yy97f0Kp1f7hzr_5k",
    "crv": "p-256"
  },
  "client_identity": {
    "acl_name": "joe",
    "acl_group": ["users"]
  },
  "acl_effective_mask": "READ_ALL",
  "client_headers": {},
  "cdmi_objectID": "0000000800182F9E64313363323731622D363536662D3465",
  "cdmi_operation": "cdmi_read",
  "cdmi_enc_key_id": "0000000800182F9E64313363323731622D363536662D3465"
}
```

The DAC provider processes the request, obtains the object decryption key and returns the following DAC response:

```
{
  "dac_response_version": "1",
  "dac_response_id": "b79d7619-1bbd-45a1-b2d3-5753f7fc5155",
  "dac_applied_mask": "ALL_PERMS",
  "dac_object_key": {
    "kty": "oct",
    "kid": "0000000800182F9E64313363323731622D363536662D3465",
    "use": "enc",
    "alg": "dir",
    "k": "vBX811eh8ydyI08by7L13kKZNmfRHATMe5vJgMCHQU"
  },
  "dac_response_headers": {
    "CDMI-DAC-AuthInfo": "Key successfully obtained from KMS."
  },
  "dac_key_cache_expiry": "2017-04-05T14:58:58Z",
  "dac_response_cache_expiry": "2017-04-05T14:58:58Z"
}
```

Since the operation is allowed by the DAC provider and the key is provided, the object is decrypted by the CDMI server and the following response is sent:

```
<-- HTTP/1.1 200 OK
<-- Content-Type: text/plain
<-- Content-Length: 252
<--
<-- <Decrypted contents of Encrypted Value>
```

EXAMPLE 4: RSA Example

In this example, there are two hospitals (A and B), that both have CDMI servers, and federate objects between them. At some point, the following encrypted object has been made at hospital A. It contains a cdmi_dac_certificate and cdmi_dac_uri that indicate how access can be requested at hospital A. The certificate contains a 2048-bit RSA encryption key, with a matching X.509 certification chain that can be used to verify the certificate.

```
{
  "objectType": "application/cdmi-object",
  "objectName": "MyEncryptedObject.txt",
  "capabilitiesURI": "/cdmi_capabilities/dataobject/",
  "objectID": "0000000800182F9E344363131393061372613735302D3438",
  "mimetype": "application/jose+json",
  "metadata": {
    "cdmi_size": "306",
    "cdmi_atime": "2017-04-06T14:06:34",
    "cdmi_enc_key_id": "encryption_key_1",
  }
}
```
"cdmi_dac_certificate": {
  "kty": "RSA",
  "kid": "cdmi.hos-a.fr_encrypt_public",
  "key_ops": [
    "wrapKey",
    "unwrapKey",
    "encrypt",
    "decrypt"
  ],

This encrypted object has been federated to the CDMI server at hospital B. Now, one of its clients wants to transparently access the plaintext of this object by performing the following operation:

```
--> GET /cdmi/2.0.0/MyContainer/MyEncryptedObject.txt HTTP/1.1
--> Host: cdmi.hos-b.us:9002
--> Accept: */*
```

The CDMI server at hospital B will look up the object and find out that it is an encrypted object with DAC information attached. As a result it will generate the following (plain) DAC request:

```
{  "dac_request_version": "1",  "dac_request_id": "73da04e1-2182-447e-8342-f4b9f06ec936",  "server_identity": {    "kty": "RSA",    "kid": "cdmi.hos-b.us_encrypt_public",    "key_ops": [      "wrapKey",      "unwrapKey",      "encrypt",      "decrypt"    ],    "n": "E8y3m02DwF0sobAs6uU8353yvxF1264MywK0J5tIGL=5j9KXF6Sgw3zuLVJxMP1MxKsJn9mHMcFvaL2zZvlwrLhrD1aCNVEC48gR26ew6NX1ptnSc1Wx43M=0NMVxV8Z

```

(continues on next page)
This plain DAC request will be JWE encrypted using the key found in the object's `cdmi_dac_certificate` (key id 'cdmi.hos-a.fr_encrypt_public'). Then it will be JWS signed using hospital B’s private signing key. Since this signing key is not equal to the encryption key (in `server_identity`) it is embedded in the JOSE protected header of the JWS (note: Base64 decode of the protected header reveals the signing key; Base64 decode of the payload reveals the JWE).
The DAC provider at hospital A will retrieve the signing key from the JOSE protected header, validate it using the included X.509 certificates, and then verify/decrypt. It creates the following (plain) DAC response. Note that it included the object decryption key.

```json
{
  "dac_response_version": "1",
  "dac_response_id": "73da04e1-2182-447e-8342-f4b9f06ec936",
  "dac_applied_mask": "ALL_PERMS",
  "dac_object_key": {
    "kty": "oct",
    "kid": "encryption_key_1",
    "use": "enc",
    "alg": "A256KW",
    "k": "1mk_8n9GZJTLDUEuxBYT-9GO8bC_fR2qqt03rVSRFak"
  },
  "dac_response_headers": {
    "CDMI-DAC-AuthInfo": "Key successfully obtained from KMS."
  },
  "dac_key_cache_expiry": "2017-04-06T14:42:47.393Z",
  "dac_response_cache_expiry": "2017-04-06T14:42:47.393Z"
}
```

As before, DAC response will be JWE encrypted using the key in server_identity. The result will be:

```json
{
  "dac_response_version": "1",
  "dac_response_id": "73da04e1-2182-447e-8342-f4b9f06ec936",
  "dac_applied_mask": "ALL_PERMS",
  "dac_object_key": {

Cloud Data Management Interface 2.0.0a

(continued from previous page)

© SNIA 2020 SNIA Working Draft 319
The CDMI server at Hospital B can now decrypt this message, process the access control decision, and use the object key to decrypt the encrypted object:

```plaintext
HTTP/1.1 200 OK
Content-Type: text/plain
Content-Length: 33

This is an unencrypted text file.
```
Clause 25

Data object versions

25.1 Overview

Data object versioning supports multiple client use cases:

- Clients can preserve all data written to a data object over time by using versions to retain all updates made to a data object.
- Clients can control how long and much many historical versions are retained by specifying constraints in data system metadata.
- Clients can restore the contents of a historical version by copying it into the version-enabled data object.
- Clients can consistently retrieve data object values using multiple parallel or sequential transactions without worrying about corruption due to concurrent updates by using the current version data object.
- Clients can detect where concurrent updates have occurred and can access any overwritten data by iterating through historical versions.
- Distributed CDMI implementations can merge concurrent changes made on different, eventually consistent nodes without resulting in data loss.

Version-enabled data objects allow the previous state of a data object to be retained when an update is performed. In a non-version-enabled data object, each update changes the state of the object and the previous state is lost. This mode of operation is shown in Fig. 20.

Fig. 20: Updates to a non-version-enabled data object
When a data object has versioning enabled, each update creates a new “current version” with the same contents of the version-enabled data object, with the previous current version becoming a historical version. The current version and all historical versions can be accessed by ID, and are immutable. The version-enabled data object continues to be mutable and has the same behaviors to clients as a non-version-enabled data object. This behavior is shown in Fig. 21 from the perspective of a client.

Using this approach, CDMI clients that are not aware of versioning can continue to access version-enabled data objects the same way as non-version-enabled data objects, while CDMI clients that are aware of versioning can access and manage the immutable versions associated with the version-enabled data object.

Versioning is enabled for a data object by adding a data system metadata item that indicates that versioning is desired. Version-enabled data objects and all associated versions contain additional storage system metadata items. These metadata items allow a client to discover the versions that are associated with a version-enabled data object and to iterate through these versions.

The maximum number of versions to be retained, maximum age of versions to be retained, and the maximum space that can be consumed by versions is controlled by data system metadata.

When a data object is version enabled, it always contains at least one version, the “current version”. The current version has the same contents as the version-enabled data object but has a different identifier (URI and Object Identifier) and is immutable. When a version-enabled data object is changed, a new current version is created, and the previous current version becomes a historical version.

<table>
<thead>

</tbody>
</table>

Fig. 21: Updates to a version-enabled data object
25.2 Traversing version-enabled data objects

Version-enabled data objects have additional metadata items that allow a client to discover and traverse historical versions.

Version-enabled data objects shall contain the following metadata items, as shown in Table 159.

<table>
<thead>
<tr>
<th>Metadata Item Name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_version_current</td>
<td>JSON String</td>
<td>The URI of the current version of the version-enabled data object. This metadata item shall be present in the version-enabled data object and all historical versions.</td>
<td>Conditional</td>
</tr>
<tr>
<td>cdmi_version_oldest</td>
<td>JSON Array of JSON Strings</td>
<td>One or more URIs of the oldest version(s). This metadata item shall be present in the version-enabled data object, the current version and all historical versions except the oldest historical versions.</td>
<td>Conditional</td>
</tr>
<tr>
<td>cdmi_version_object</td>
<td>JSON String</td>
<td>The URI of the version-enabled data object. This metadata item shall be present in the current version and all historical versions.</td>
<td>Conditional</td>
</tr>
<tr>
<td>cdmi_version_parent</td>
<td>JSON String</td>
<td>The URI of the previous historical version. This metadata item shall be present in the current version and all historical versions except the oldest historical versions.</td>
<td>Conditional</td>
</tr>
<tr>
<td>cdmi_version_children</td>
<td>JSON Array of JSON Strings</td>
<td>One or more URIs of historical versions (or the current version) created by updating a given historical version. This metadata item shall be present in all historical versions.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

Situations where a version-enabled data object or a historical data object may have multiple oldest versions or multiple children is explained in 25.3.

To visualize how these metadata items allow a client to traverse data object versions, the linkages between the version-enabled data object and data object versions in the final state of Fig. 21 is shown in Fig. 22.

Fig. 22: Linkages between a version-enabled data object and data object versions

A client accessing the version-enabled data object (/b.txt) can traverse to the current version and to the oldest version.

A client accessing a data object version can traverse to the version-enabled data object, to the current version, to the parent version, to child versions, and to the oldest version.
25.3 Concurrent updates and version-enabled data objects

When multiple concurrent updates are performed against a version-enabled data object, each update is performed against the state of the object at the time the update starts. The change to the state resulting from the update to the object becomes visible to clients at the time the update completes.

Two different types of concurrent updates can occur: overlapping updates and nested updates.

Fig. 23 and Fig. 24 show the update sequence and resulting version linkages for overlapping updates:

In the sequence shown in Fig. 23, both the “Second” and “Third” updates are performed against the “First” state. As the “Third” update completes last, it becomes the current version. In this example, historical version 00007ED...8EA would have two children, versions 00007ED...552 and 00007ED...D21. Both versions 00007ED...552 and 00007ED...D21 would have the same parent 00007ED...8EA.
Fig. 25 and Fig. 26 show the update sequence and resulting version linkages for nested updates:

![CDMI Client A](http://example.com)  ![CDMI Server](http://example.com)  ![CDMI Client B](http://example.com)

In the sequence shown in these figures, both the "Second" and "Third" updates are performed against the "First" state. As the "Second" update completes last, it becomes the current version. In this example, historical version `00007ED..8EA` would have two children, versions `00007ED..552` and `00007ED..D21`. Both versions `00007ED..552` and `00007ED..D21` would have the same parent `00007ED..8EA`.

Both of these data structures are equivalent, with the only difference being which update completed last.
25.4 Capabilities for version-enabled data objects

The relationship between version-enabled data objects, data object versions, and capabilities is shown in Fig. 27.

Data object versions are immutable but may be deleted by a client or by the system, depending on the data system metadata specified.
25.5 Updates triggering version creation

If versioning is enabled by setting the value of the `cdmi_versions` metadata item in the version-enabled data object to "value", the following updates will trigger the creation of a new version:

- changing the mime type,
- changing the value, or
- changing the value transfer encoding.

If versioning is enabled by setting the value of the `cdmi_versions` metadata item in the version-enabled data object to "user", the following updates will trigger the creation of a new version:

- changing the mime type,
- changing the value,
- changing the value transfer encoding, or
- adding, modifying, or removing user metadata.

If versioning is enabled by setting the value of the `cdmi_versions` metadata item in the version-enabled data object to "all", then all updates to the data object will trigger the creation of a new version.

While ACLs for historical versions are left unchanged, the effective ACL, owner, and domain of historical versions shall be the ACL, owner, and domain of the current version-enabled data object. This means that changing the ACL of a versioned data object also overrides the historical version ACL for all previous versions.

Modifications performed with the X-CDMI-Partial header shall not trigger the creation of a new version until the completionStatus is changed from "Processing" to "Complete".
25.6 Operations on version-enabled data objects

Moving a version-enabled data object within a system is considered to be an update to the \texttt{name} and/or \texttt{parentURI} fields.

Moving a version-enabled data object between systems moves all data object versions associated with the version-enabled data object and preserves all identifiers. If the destination name and/or URI are different, the move is considered to be an update to the \texttt{name} and/or \texttt{parentURI} fields.

Copying a version-enabled data object shall only copy the current version of the version-enabled data object. Versions of the version-enabled data object are not copied.

Deleting a version-enabled data object shall also delete all versions associated with that version-enabled data object.

Disabling versioning for a version-enabled data object shall preserve all versions. Previously existing versioning metadata shall remain present while versioning is disabled. Re-enabling versioning for a data object that previously was version-enabled shall result in the creation of a new current version.

If a version-enabled data object is placed under retention or hold, the retention behaviors of the version-enabled data object shall be applied to the data object versions.

No additional notifications are defined for version-enabled data objects. When a version-enabled data object is updated, an additional creation notification message shall be generated for the created data object version. Likewise, when a data object version is accessed or deleted, a notification message is generated. If a limited number, size, or age for versions is requested and a change to a version-enabled data object results in a version being automatically deleted, then the system shall generate a corresponding deletion notification message for the deleted data object version.
25.7 Operations on data object versions

A data object version is presented to the client as a standard CDMI data object.

Moving, copying over, deserializing over, and updating a data object version shall not be permitted and shall result in an HTTP status code of 403 Forbidden.

Copying a data object version is permitted. For example, to promote a version to become the current version of a version-enabled data object, the URI of the data object version is used in the copy field when performing an update to the URI of the version-enabled data object. Updates may also be performed as part of the copy operation.

Deleting the current version or historical versions shall maintain the relationships in Table 159.

Deleting the current version shall revert the current version to the parent. If there is no parent version, deleting the current version shall result in an HTTP status code of 403 Forbidden.

Deleting a historical version shall only be permitted when the client has ACL permissions to delete the historical version and has ACL permissions to delete the version-enabled data object.

Deleting a historical version shall use the domainURI metadata of the version-enabled data object.

Reading a historical version shall update the cdmi_acount and cdmi_atime of the historical version, when present.

Reading a historical version shall only be permitted when the client has ACL permissions to read the historical version and has ACL permissions to read the version-enabled data object.

Reading a historical version shall use the domainURI metadata of the version-enabled data object.

Standard notification messages are sent when data object versions are read or deleted.
25.8 Query of data object versions

Data object versions are regular CDMI objects, consequently they will be included in query results unless explicitly excluded.

Querying for data object versions is performed by including the scope:

```json
"metadata" : {
    "cdmi_version_children" : "*"
}
```

Querying for version-enabled data objects (but not their versions) is performed by including the scope:

```json
"metadata" : {
    "cdmi_versioning" : "*
}
```

Querying for non-versioned data objects with no versions is performed by including the scope:

```json
"metadata" : {
    "cdmi_version_current" : "!*"
}
```

Querying for non-versioned data objects with versions is performed by including the scope:

```json
"metadata" : {
    "cdmi_versioning" : "!*",
    "cdmi_version_current" : "*"
}
```
Version-enabled data objects are serialized by performing the following steps:

- Serialize the current version and all historical versions as described in 15.2.
- Place the serialized current version and historical versions into a JSON Array.
- Serialize the version-enabled data object as described in 15.2.
- Replace the value field in the serialized version-enabled data object with the JSON Array containing the serialized current version and historical versions.

Serializing a non-version-enabled data object that has versions shall follow the same process.

EXAMPLE 1: A version-enabled data object with two historical versions is serialized.

```json
{
  "objectType": "application/cdmi-object",
  "objectID": "00007ED900100DA32EC94351F8970400",
  "objectName": "MyVersionedDataObject.txt",
  "parentURI": "/MyContainer/",
  "parentID": "00007E7F00102E230ED82694DA975D2",
  "domainURI": "/cdmi_domains/MyDomain/",
  "capabilitiesURI": "/cdmi_capabilities/dataobject/",
  "completionStatus": "Complete",
  "mimetype": "text/plain",
  "metadata": {
    "cdmi_size": "33",
    "cdmi_versioning": "user",
    "cdmi_version_object": "/cdmi_objectid/00007ED900100DA32EC94351F8970400",
    "cdmi_version_current": "/cdmi_objectid/00007ED90010F077F4EB1C99C87524CC",
    "cdmi_version_oldest": [ 
      "/cdmi_objectid/00007ED900100512EB55A9304EAC5D4AA"
    ],
    ...
  },
  "value": [{
    "objectType": "application/cdmi-object",
    "objectID": "00007ED900100DA32EC94351F8970400",
    "objectName": "MyVersionedDataObject.txt",
    "parentURI": "/MyContainer/",
    "parentID": "00007E7F00102E230ED82694DA975D2",
    "domainURI": "/cdmi_domains/MyDomain/",
    "capabilitiesURI": "/cdmi_capabilities/dataobject/dataobject_version/>
    "completionStatus": "Complete",
    "mimetype": "text/plain",
    "metadata": {
      "cdmi_size": "33",
      "cdmi_version_object": "/cdmi_objectid/00007ED900100DA32EC94351F8970400",
      "cdmi_version_current": "/cdmi_objectid/00007ED90010F077F4EB1C99C87524CC",
      "cdmi_version_oldest": [ 
        "/cdmi_objectid/00007ED900100512EB55A9304EAC5D4AA"
      ],
      "cdmi_version_parent": "/cdmi_objectid/00007ED9001005192B9EEBE599D94BB",
      "cdmi_version_children": [ ],
      ...
    },
    "valuerange": "0-32",
    "valuetransferencoding": "utf-8",
    "value": "Third version of this Data Object"
  },
  "objectType": "application/cdmi-object",
```
Deserializing a version-enabled data object or a non-version-enabled data object with versions shall restore the data object and all serialized versions.

Individually serializing and deserializing current versions or historical versions shall not be permitted.

Deserializing a serialized any data object with versions onto a system that does not support versions shall result in an HTTP status code of 400 Bad Request.
Part V

CDMI Annexes
Clause 26

Extensions

26.1 Overview

CDMI extensions describe non-normative additional functionality for extending the CDMI International Standard. Each extension is first written as a standalone document that describes the changes that are required to implement the functionality being added into this International Standard.

When one or more vendors have implemented a CDMI extension, it is eligible to be added to this annex. When multiple vendors have implemented a CDMI extension and demonstrated interoperability, the extension is eligible to be merged into the CDMI International Standard itself, at which point it becomes normative.

CDMI extensions shall not break or modify existing functionality, and thus do not result in compatibility problems with existing clients. Compatibility is typically accomplished by relaxing restrictions imposed in the current CDMI International Standard, adding new fields, or using reserved names for metadata. The clients that are using CDMI capabilities can identify the functionality that is associated with these CDMI extensions.
26.2 Summary metadata for bandwidth

26.2.1 Overview

Domain summaries provide summary measurement information about domain usage and billing. Some systems may track additional usage and billing information related to network bandwidth. This extension proposes a set of additional, optional contents for domain summary objects.

26.2.2 Changes to specification

Add new terms to clause 3:

private network segment a single IP address or range of IP addresses that are considered internal (e.g., LAN)
public network segment a single IP address or range of IP addresses that are considered external (e.g., WAN)

Add table entries to end of Table 79 in 10.3:

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_summary_network_bytes</td>
<td>JSON</td>
<td>Total number of bytes read/written to/from public/private network segments</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_summary_read_private</td>
<td>JSON</td>
<td>Total number of bytes read from private network segment</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_summary_read_private_min</td>
<td>JSON</td>
<td>Minimum number of bytes read from private network segment for the given interval</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_summary_read_private_max</td>
<td>JSON</td>
<td>Maximum number of bytes read from private network segment for the given interval</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_summary_read_private_avg</td>
<td>JSON</td>
<td>Average number of bytes read from private network segment for the given interval</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_summary_write_private</td>
<td>JSON</td>
<td>Total number of bytes written to private network segment</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_summary_write_private_min</td>
<td>JSON</td>
<td>Minimum number of bytes written to private network segment for the given interval</td>
<td>Optional</td>
</tr>
<tr>
<td>cdmi_summary_write_private_max</td>
<td>JSON</td>
<td>Maximum number of bytes written to private network segment for the given interval</td>
<td>Optional</td>
</tr>

<td>Optional</td>
</tr>
</tbody>
</table>
26.3 Expiring access control entries (ACEs)

26.3.1 Overview

A common trait of cloud storage services is the ability to share an object with other clients for a limited time. This extension adds an attribute of ACEs used in ACLs that imposes a time limit (expiration) on the ACE. Once the ACE expires, the ACE is no longer valid or included in the authorization calculation for the object.

26.3.2 Changes to specification

Insert into 17.2.7:

After the bullet item:

• ACEs that do not refer to the principal P requesting the operation are ignored.

Insert bullet:

• ACEs that have an expiration value less than the current time are ignored.

Change 17.2.7:

Original text:

\[
\text{ACE} = \{ \text{acetype}, \text{identifier}, \text{aceflags}, \text{acemask}, \text{acetime} \}
\]

Revised text:

\[
\text{ACE} = \{ \text{acetype}, \text{identifier}, \text{aceflags}, \text{acemask}, \text{acetime}, \text{expiration} \}
\]

Insert into 17.2.7 after "\text{acemask} = \text{uint}_t | \text{acemaskstring}":

\[
\text{expiration} = \text{uint}_t
\]

Insert into 17.2.7 after "When ACE masks...":

When ACE expiration is presented in string format, it shall be specified in ISO-8601 point-in-time format as described in 5.6.

Insert a new sub-clause after 17.2.10: "ACE expiration"

An ACE may have an optional expiration associated with it. The expiration is a point-in-time value, in ISO-8601 point-in-time format, as described in 5.6, which specifies that the ACE is no longer valid and shall be ignored after the time specified.
26.4 Group storage system metadata

26.4.1 Overview

ACLs in CDMI can refer to the owner of an object by specifying an ACE Who of "OWNER@". This reference corresponds to the contents of the cdmi_owner storage system metadata. However, no cdmi_group storage system metadata corresponds to an ACE Who of "GROUP@".

This extension defines a new storage system metadata item, cdmi_group, that allows an object to be associated with a group for ACL evaluation purposes.

26.4.2 Changes to specification

Add a new row at end of table Table 126 in 12.2.9:

<table>
<thead>
<tr>
<th>Capability name</th>
<th>Type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_group</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the cloud storage system supports group storage system metadata to indicate a group associated with the object.</td>
</tr>
</tbody>
</table>

Add a new row below "cdmi_owner" in Table 141 of 16.2:

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_group</td>
<td>JSON string</td>
<td>The name of the group that is associated with the object.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
26.5 Header-based metadata

26.5.1 Overview

The CDMI protocol enables CDMI-aware clients to store and retrieve structured metadata using JSON bodies, but does not permit HTTP-based clients to access this metadata. This extension extends CDMI metadata to permit HTTP header metadata to be stored and retrieved as a subset of CDMI metadata.

Due to limitations associated with HTTP headers, certain restrictions must be placed on metadata that is accessible via headers.

26.5.2 Changes to specification

Add a new row at end of table Table 9 in 6.2:

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-<em>-meta-</em></td>
<td>Header</td>
<td>If the “cdmi_header_metadata” capability is present, for each request header matching the pattern “x-<em>-meta-</em>”, a new user metadata item shall be created, with the metadata name set to the header field-name, and the metadata value set to the header field-value. If the number of headers, the length of any of the headers, or the total size of the headers exceeds the limits specified in RFC 2616, or specified by the cdmi_header_metadata_maxitems, cdmi_header_metadata_maxsize, or the cdmi_header_metadata_maxtotalsize capabilities, a 400 Bad Request shall be returned to the client.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

Add new example at end of 6.2:

EXAMPLE 1: PUT to the container URI the data object name, contents, and metadata:

```
--> PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
--> Content-Type: text/plain;charset=utf-8
--> X-CDMI-Meta-Colour: Yellow
--> X-Object-Meta-Shape: Square
--> Content-Length: 37

<-- This is the Value of this Data Object

<-- HTTP/1.1 201 Created
```

After 6.2, add a new clause “Inspect a Data Object using HTTP”:

26.5.3 Synopsis

To check for the presence of a data object, the following request shall be performed:
• HEAD <root URI>/<ContainerName>/<DataObjectName>

Where:

• <root URI> is the path to the CDMI cloud.
• <ContainerName> is zero or more intermediate containers that already exist, with one slash (i.e., "/") between each pair of container names.
• <DataObjectName> is the name specified for the data object to be checked.

The object shall also also be able to be checked at <root URI>/cdmi_objectid/<objectID>.

26.5.4 Capabilities

The following capabilities describe the supported operations that may be performed when reading an existing data object:

• Support for the ability to read the metadata of an existing data object is indicated by the presence of the cdmi_read_metadata capability in the specified object.

26.5.5 Request headers

Request headers may be provided as per RFC 2616.

26.5.6 Request message body

A request message body shall not be provided.

26.5.7 Response headers

The HTTP response headers for checking for the presence of a data object using HTTP are shown in Table 161.

Table 161: Response headers - Inspect a data object using HTTP

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header</td>
<td>The content type returned shall be the mimetype field in the data object.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Location</td>
<td>Header</td>
<td>The server shall respond with the URI that the reference redirects to if the object is a reference.</td>
<td>Conditional</td>
</tr>
<tr>
<td>x-<em>-</em>-meta-*</td>
<td>Header</td>
<td>If the &quot;cdmi_header_metadata&quot; capability is present, for each user metadata item in the &quot;metadata&quot; field with a metadata name that is a case-insensitive match to the pattern &quot;x-<em>-</em>-meta-*&quot;, a corresponding response header shall be returned to the client where the header field-name shall be the metadata item name, and the header field-value shall be the metadata item value. If a header value to be return is not conformant with RFC 2616, the server may omit the field from the response headers.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

26.5.8 Response message body

No response body shall be provided, as per RFC 2616.
### 26.5.9 Response status

The HTTP status codes that occur when checking the presence of a data object using HTTP are described in Table 162.

<table>
<thead>
<tr>
<th>HTTP status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 OK</td>
<td>The queue object content was returned in the response.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
</tbody>
</table>

### 26.5.10 Example

**EXAMPLE 1:** HEAD to the data object URI to check for the presence of a data object with header metadata:

```
--> HEAD /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 200 OK
<-- Content-Type: text/plain
<-- Content-Length: 37
<-- X-CDMI-Meta-Colour: Yellow
<-- X-Object-Meta-Shape: Square
```

Add a new row at end of table Table 13 in 6.3:

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-<em>-meta-</em></td>
<td>Header string</td>
<td>If the &quot;cdmi_header_metadata&quot; capability is present, for each user metadata item in the &quot;metadata&quot; field with a metadata name that is a case-insensitive match to the pattern &quot;x-<em>-meta-</em>&quot;, a corresponding response header shall be returned to the client where the header field-name shall be the metadata item name, and the header field-value shall be the metadata item value. If a header value to be return is not conformant with RFC 2616, the server may omit the field from the response headers.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

Add new example at end of 6.3:

**EXAMPLE 6:** GET to the data object URI to read the value of the data object with header metadata:

```
--> GET /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1
--> Host: cloud.example.com
<-- HTTP/1.1 200 OK
<-- Content-Type: text/plain
<-- Content-Length: 37
```

(continues on next page)
Add a new row at end of table Table 16 in 6.4:

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| x-*-meta-* | Header string | If the "cdmi_header_metadata" capability is present, for each request header matching the pattern "x-*-meta-!", a new user metadata item shall be created, or an existing metadata item shall be updated, with the metadata name set to the header field-name, and the metadata value set to the header field-value.  
If a metadata item already exists where the metadata name and the header field-name differ only in case, the existing metadata item value shall be updated.  
If an empty header field-value is specified, the corresponding metadata item shall be removed from the object.  
If the number of headers, the length of any of the headers, or the total size of the headers exceeds the limits specified in RFC 2616, or specified by the cdmi_header_metadata_maxitems, cdmi_header_metadata_maxsize, or the cdmi_header_metadata_maxtotalsize capabilities, a 400 Bad Request shall be returned to the client. | Conditional   |

Add new example at end of 6.4:

EXAMPLE 3: PUT to the data object URI to update the value and metadata of the data object:

```plaintext
--> PUT /cdmi/2.0.0/MyContainer/MyDataObject.txt HTTP/1.1  
--> Host: cloud.example.com  
--> Content-Type: text/plain;charset=utf-8  
--> X-CDMI-Meta-Colour: Green  
--> Content-Length: 41  

<-- This is the new Value of this Data Object  

<-- HTTP/1.1 204 No Content
```

Add a new table to Request Headers in 7.2:
Table 163: Request headers - Create a container object using HTTP

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-**-meta-*</td>
<td>Header</td>
<td>If the &quot;cdmi_header_metadata&quot; capability is present, for each request header matching the pattern &quot;x-**-meta-*&quot;, a new user metadata item shall be created, with the metadata name set to the header field-name, and the metadata value set to the header field-value. If the number of headers, the length of any of the headers, or the total size of the headers exceeds the limits specified in RFC 2616, or specified by the cdmi_header_metadata_maxitems, cdmi_header_metadata_maxsize, or the cdmi_header_metadata_maxtotalsize capabilities, a 400 Bad Request shall be returned to the client.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

Add new example at end of 7.2:

EXAMPLE 2: PUT to the URI the container object name and metadata:

```
--> PUT /cdmi/2.0.0/MyContainer/ HTTP/1.1
--> Host: cloud.example.com
--> X-CDMI-Meta-Colour: Yellow
<-- HTTP/1.1 201 Created
```

After 7.2, add a new sub-clause “Inspect a container object using HTTP”:

### 26.5.11 Synopsis

To check for the presence of a container object, the following request shall be performed:

- HEAD <root URI>/<ContainerName>/<TheContainerName>/

Where:

- `<root URI>` is the path to the CDMI cloud.
- `<ContainerName>` is zero or more intermediate containers that already exist, with one slash (i.e., "/") between each pair of container names.
- `<TheContainerName>` is the name specified for the container object to be checked.

The container object shall also also be able to be checked at `<root URI>/cdmi_objectid/<objectID>`.

### 26.5.12 Capabilities

The following capabilities describe the supported operations that may be performed when reading an existing container object:

- Support for the ability to read the metadata of an existing container object is indicated by the presence of the `cdmi_read_metadata` capability in the specified container object.
26.5.13 Request headers

Request headers may be provided as per RFC 2616.

26.5.14 Request message body

A request message body shall not be provided.

26.5.15 Response headers

The HTTP response headers for checking for the presence of a CDMI container object using HTTP are shown in Table 164.

Table 164: Response Headers - Inspect a container object using HTTP

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Header string</td>
<td>&quot;application/cdmi-container&quot;</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Location</td>
<td>Header string</td>
<td>The server shall respond with the URI that the reference redirects to if the object is a reference.</td>
<td>Conditional</td>
</tr>
<tr>
<td>x-[*-meta-*</td>
<td>Header string</td>
<td>If the &quot;cdmi_header_metadata&quot; capability is present, for each user metadata item in the &quot;metadata&quot; field with a metadata name that is a case-insensitive match to the pattern &quot;x-[*-meta-*&quot;, a corresponding response header shall be returned to the client where the header field-name shall be the metadata item name, and the header field-value shall be the metadata item value. If a header value to be return is not conformant with RFC 2616, the server may omit the field from the response headers.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

26.5.16 Response message body

No response body shall be provided, as per RFC 2616.

26.5.17 Response status

The HTTP status codes that occur when checking the presence of a container object using HTTP are described in Table 165.

Table 165: HTTP status codes - Inspect a container object using HTTP

<table>
<thead>
<tr>
<th>HTTP Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 OK</td>
<td>The queue object content was returned in the response.</td>
</tr>
<tr>
<td>302 Found</td>
<td>The resource is a reference to another resource.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request contains invalid parameters or field names.</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The client lacks the proper authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found at the specified URI.</td>
</tr>
</tbody>
</table>

26.5.18 Example

EXAMPLE 1: HEAD to the container object URI to check for the presence of a container object with header metadata:
Replace contents of 7.3 with:

26.5.19 Synopsis

Reading a container object using HTTP is not defined by this version of this international standard. 9.4 describes how to read a container object using CDMI.

A server implementation is free to respond to HTTP GETs for Container Objects in any way that conforms with RFC 2616.

If container object metadata items matching the pattern "x-*-meta-*" are present, these metadata items shall be returned as response headers as per 9.4.

Replace contents of 7.4 with:

26.5.20 Synopsis

Updating a container object using HTTP is not defined by this version of this international standard. clause 9.5 describes how to update a container object using CDMI.

A server implementation is free to respond to HTTP PUTs for existing Container Objects in any way that conforms with RFC 2616.

If container object metadata items matching the pattern "x-*-meta-*" are present, these metadata items shall be returned as response headers as per 9.5.

Add new rows to end of Table 124 in 12.2.7:

<table>
<thead>
<tr>
<th>Capability name</th>
<th>Type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmi_header_metadata</td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, this capability indicates that the cloud storage system supports header-visible metadata.</td>
</tr>
<tr>
<td>cdmi_header_metadata_maxitems</td>
<td>JSON string</td>
<td>If present, this capability indicates the maximum number of user-defined header metadata items supported per object. If absent, there is no additional limit placed on the number of user-defined metadata items.</td>
</tr>
<tr>
<td>cdmi_header_metadata_maxsize</td>
<td>JSON string</td>
<td>If present, this capability indicates the maximum size, in bytes, of each user-defined header metadata item. If absent, there is no additional limit placed on the size of user-defined metadata items.</td>
</tr>
</tbody>
</table>

Continued on next page
### Table 166 – continued from previous page

<table>
<thead>
<tr>
<th>Capability name</th>
<th>Type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdmı_header_metadata_maxtotalsize</td>
<td>JSON string</td>
<td>If present, this capability indicates the maximum size, in bytes, of all user-defined header metadata per object. If absent, there is no additional limit placed on the size of user-defined metadata.</td>
</tr>
</tbody>
</table>

---

Add to end of 16.5:

If metadata items with a name is a case-insensitive match to the pattern "x-*-meta-*" are created or updated through a CDMI request, the following conditions shall be true, or else a 400 Bad Request result code shall be returned to the client:

- The metadata name shall be a valid HTTP header field-name
- The metadata value that is a valid HTTP header field-value
- The number of matching headers shall not exceed the limits specified by RFC 2616, and shall not exceed the number specified in the cdmı_header_metadata_maxitems capability.
- The size of each matching header shall not exceed the limits specified by RFC 2616, and shall not exceed the number specified in the cdmı_header_metadata_maxsize capability.
- The total size of all of the matching headers shall not exceed the limits specified by RFC 2616, and shall not exceed the number specified in the cdmı_header_metadata_maxtotalsize capability.
26.6 Immediate query

26.6.1 Overview

CDMI provides a query mechanism based around the concept of persistence. A query queue is created, metadata is specified that defines the query operation, the query is performed asynchronously, and results are populated in the queue and then read by the client as separate operations.

This architecture, while providing significant value, is complex for clients that do not need to persist the results of a query. Specifically, a client must: a) asynchronously poll the query queue to determine when results are present and when the query has completed, and b) delete the queue when results are no longer needed.

To provide a simpler interface for simple queries where a small number of results are expected and persistence is not required, the TWG has proposed the following approach to allow query queues to optionally not be persistent, with the results being returned immediately as the response to the initial query queue creation.

In addition, functionality that permits results to be returned immediately has been added to creating asynchronous query queues.

26.6.2 Changes to specification

Modify existing `cdmi_query` entry in Table 124 in 12.2.7:

<table>
<thead>
<tr>
<th>Capability name</th>
<th>Type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cdmi_query</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, the CDMI server supports persistent query queues.</td>
</tr>
</tbody>
</table>

Add a new row at end of table Table 124 in 12.2.7:

<table>
<thead>
<tr>
<th>Capability name</th>
<th>Type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cdmi_query_immediate</code></td>
<td>JSON string</td>
<td>If present and &quot;true&quot;, the CDMI server supports immediate query queues.</td>
</tr>
</tbody>
</table>

Replace the first paragraph of Overview in clause 22 with:

A cloud storage system may optionally implement metadata and/or full-text query functionality. The implementation of query is indicated by the presence of the cloud storage system-wide capabilities for query and requires support for CDMI queues when persisting query results.

Replace the third paragraph of Overview in clause 22 with:

When a client wishes to perform queries, it shall first determine if the system is capable of providing query functionality by checking to see if the `cdmi_query` or `cdmi_query_immediate` capabilities are present in the root container capabilities. If these capabilities are not present and queues are supported, creating a query queue shall be successful, but no query results shall be enqueued into the query queue.
Modify existing `cdmi_queue_type` entry in Table 152 in 22:

<table>
<thead>
<tr>
<th>Metadata name</th>
<th>Type</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cdmi_queue_type</code></td>
<td>JSON-string</td>
<td>Queue type indicates how the cloud storage system shall manage the queue object. The defined values are:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;cdmi_query_queue&quot; – Perform an asynchronous query, which may return none, some, or all results in the request response body. A new queue object shall be created.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;cdmi_query_immediate&quot; – Perform a synchronous query, returning all matching results in the request response body. The query queue object may not be accessible and shall be automatically deleted when the query completes.</td>
<td></td>
</tr>
</tbody>
</table>

Add new clause "Immediate Queries" to end of 22:

If "cdmi_query_immediate" is specified in `cdmi_queue_type`, all query results shall be immediately returned in the response body as shown in the following example.

**EXAMPLE 3: Perform an Immediate Query:**

```
  --> PUT /cdmi/2.0.0/MyContainer/myQuery HTTP/1.1  
  --> Host: cloud.example.com  
  --> Accept: application/cdmi-queue  
  --> Content-Type: application/cdmi-queue  
  -->  
  --> {  
  -->   "metadata": {  
  -->     "cdmi_queue_type": "cdmi_query_immediate",  
  -->     "cdmi_scope_specification": {  
  -->       "domainURI": "/cdmi_domains/MyDomain/",  
  -->       "parentURI": "starts /sandbox",  
  -->       "metadata": {  
  -->         "cdmi_size": "#> 100000"  
  -->       }  
  -->     }  
  -->   }  
  --> }  
  <--- HTTP/1.1 201 Created  
  <--- Content-Type: application/cdmi-queue  
  <--- Location: https://cloud.example.com/cdmi/2.0.0/MyContainer/myQuery  
  <---
```
(continues on next page)
Where the value of the above base64 encoded value is:

```
4416
EXAMPLE 4: An example of the metadata associated with a query queue is as follows:

```
4417

```
