## Data Affinity CDMI Extension

3

*Version 2.0*

4

5 ABSTRACT: This CDMI Extension is intended for developers who are considering a standardized way to add  
6 functionality to CDMI. When multiple compatible implementations are demonstrated and approved by the Technical  
7 Working Group, this extension will be incorporated into the CDMI standard.

8 This document has been released and approved by the SNIA. The SNIA believes that the ideas, methodologies, and  
9 technologies described in this document accurately represent the SNIA goals and are appropriate for widespread  
10 distribution. Suggestion for revision should be directed to <http://www.snia.org/feedback/>.

## Clause 1

# Location Affinity CDMI Extension

## 1.1 Overview

Cloud storage systems may be distributed over more than a single location. Clients of the system need to explicitly specify that an object exists in a particular location due to proximity to other resources (compute resources, people, etc.). This extension proposes a new capability that allows metadata on an object that dictates the locations where the object should exist.

Affinity is similar to the `cdmi_geographic_placement` capability in that it suggests to the system where an object can or cannot be located. However, affinity is a much stronger attribute, as it directs an object or copies of an object to exist in specific locations that may be more finely grained than geopolitical borders (data center, physical building location, etc.).

The affinity of an object may have implications to the `cdmi_data_redundancy_provided` data systems metadata value of an object. If more than one location is specified in the value for `cdmi_data_affinity`, additional copies of the object may be implied by the system, which would adjust the `cdmi_data_redundancy_provided` value.

## 1.2 Instructions to the Editor

To merge this extension into the CDMI 2.0.0 specification, make the following changes:

1. Add an entry to the end of the table starting on line 451 of `cdmi_capability_object.txt`, as follows:

Table 1: Capabilities for data system metadata

Capability name	Type	Definition
<code>cdmi_data_affinity</code>	JSON array of JSON strings	When the cloud storage system supports the <code>cdmi_data_affinity</code> data system metadata as defined in 16.3 Support for data system metadata, the <code>cdmi_data_affinity</code> capability shall be present and shall list the data locations available to objects using the capabilities set. If absent, the system shall determine the data location.  The JSON array items used as identifiers for locations shall be arbitrary JSON strings.

2. Add an entry to the end of the table starting on line 216 of `cdmi_metadata.txt`, as follows:

Table 2: Data system metadata

Metadata name	Type	Description	Requirement
<code>cdmi_data_affinity</code>	JSON array of JSON strings	<p>If this data system metadata item is present and not an empty array, it indicates that the client is requesting that an object be stored in a specific location. Each string in the array shall contain a unique user-specified location identifier.</p> <p>When this data system metadata item is absent or is present and is an empty JSON array, the system shall determine the data location.</p> <p>The list of location identifiers available to the object is specified by the <code>cdmi_data_affinity</code> capability (as described in 12.2.9 Data system metadata capabilities).</p>	Optional

78

3. Add an entry to the end of the table starting on line 533 of `cdmi_metadata.txt`, as follows:

Table 3: Provided values of data system metadata

Metadata name	Type	Description	Requirement
<code>cdmi_data_affinity_provided</code>	JSON array of JSON strings	Contains one or more identifiers that corresponds to locations where the object is stored.	Optional
