Abstract

- SNIA Green Update for Developers
  - This talk will outline some storage-specific topics related to energy-efficiency, including metrics for measuring, managing and designing for power. We will overview ongoing efforts in the SNIA Green Storage TWG and in partnership with The Green Grid, the DMTF and other industry groups.
Outline

- Power measurement
  - storage subsystems
  - idle and active modes
  - power supply loading & efficiencies
  - power measurement & monitoring equipment
- SNIA green storage efforts
  - green metrics & standards
  - “unplugged” fests
  - alliances
What impacts power consumption

- Storage capacity & usage efficiency
  - increasing data → larger capacity → more disks
  - redundant copies → magnify capacity needs
  - variability in usage and utilization → inefficient allocation of space
  - What is valuable data? What is the retention policy?

- Data transfer rate / access speed
  - high I/O bandwidth → higher rotational speed; striping over many drives
  - low access times → faster actuators; higher rotational speeds; caches
  - How fast and immediate must data be available? (time-to-data)

- Data integrity
  - estimates of 25% of “digital universe” is unique, 75% replicas / duplicates
  - partly to ensure data integrity and survivability; partly wasteful

- Data availability / system reliability
  - RAID uses extra drives, plus redundant power supplies, fans, controllers,
  - How valuable is data? How likely are failures? What time-to-data?
Potential paths to “green”

- Improve usage efficiency
  - Deduplication
  - Thin provisioning
- Minimize energy consumption
  - Improved component designs – high-efficiency power supplies, advanced & flexible drives
  - MAID – idle and spin-down
- New technologies
  - Solid state storage
  - Alternative storage architectures

must be driven by metrics / standards / guidelines
Anatomy of a Storage System

- System design, complexity and redundancy vary depending on applications & usage.
- Component designs, software features, and workload affect power consumption and efficiency.

Switches

Appliances

Disk Arrays

PDUs

UPSs

Power Distribution Unit

Uninterruptible Power Supply

Apps

Software

Power Supplies

Fans

Controllers

Hard drives
Using properly sized efficient power supplies benefit system in Idle & Active modes

Design must take several trade-offs into consideration
- peak load, average loads and redundant system configuration
- supplies may operate at <50% of max. load most of the time

Voltage levels (110V, 218V, 220V, 240V) also impact efficiency

Data from 45 single-voltage PSUs from 8 vendors (products available 1st Q 2009) presented by EPA at ENERGY STAR Computer Server Stakeholder Meetings in Redmond, WA; July 2008
Idle Power vs. Active Power

- **Idle Mode**
  - storage system is protecting data, ready to process IOs
  - background maintenance & optimization tasks on-going
  - factors: time-to-data, overhead electronics, fan, maintenance
  - systems are idle large fractions of the time

- **Active Mode**
  - storage system is carrying out IOs
  - background tasks continue in parallel
  - factors: workload (seq/random), response time, throughput
  - evaluate a variety of workloads, plus sustained peak power
Example of Power Measurement

- Ideally, systems consume minimum power in all modes
  - System uses **significant power in idle** (80% of max)
- % of time in Idle versus Active depends on storage type, application and workloads; available optimizations will vary
- Power consumed is not linearly proportional to workload (indicates potential room for improvement)
Measurement Tools

- Variety of power monitoring / measurement tools available
  - rack-mounted, networked PDUs for operational monitoring
  - more accurate power meters w/ data logging capabilities are preferred for system characterization and benchmarking
  - select a tool based on accuracy, features, Amp/V/Watt levels
- Measure operating conditions (temp., humidity, altitude) w/ power to establish baselines and understand system behaviors
- Both total and sub-system power consumed are valuable info.

Outline

- Power measurement
  - storage subsystems
  - idle and active modes
  - power supply loading & efficiencies
  - power measurement & monitoring equipment
- SNIA green storage efforts
  - green metrics & standards
  - “unplugged” fests
  - alliances
Metrics Examples

Workload considerations
- Data at rest — Idle power (GB/Watt)
- Data on the move — Throughput (MB/s)
- Data at work — Performance (IOPS)

Potentially useful metrics
- GB per Watt; MB/s per Watt; IOPS per Watt
- Power supply efficiency; CO₂ footprint
- Total annual energy bill

Reliability / availability / serviceability considerations
- Latency (time-to-date)
- Redundancy level (RAID efficiency, resilience to failures)
SNIA Green Efforts

- SNIA Green Storage Initiative (GSI) and Green Storage Technical Work Group (TWG)
  - on-going efforts to develop green standards & metrics
  - power measurements through multi-vendor “unplug” fests
  - next face-to-face meeting November 2008 in San Diego,
    next unplugged fest April 2009 in Colorado Springs
- Four tutorials at the upcoming SNW (October 2008)
  - Green Storage I – Economics, Environment, Energy & Engineering
  - Green Storage II – Metrics and Measurement
  - Software Technologies for Green Storage
  - Building the Green Data Center
- online tutorials available (www.snia.org/education/tutorials)
SNIA Green Alliances

- Alliances with other active green organizations
  - The Green Grid – servers & data centers
  - 80PLUS, Climate Savers – power supplies
  - DMTF – management & monitoring interfaces
  - SPEC, SPC – benchmarks & power measurement
- Collaboration with EPA on ENERGY STAR program
  - ENERGY STAR for Servers – ongoing drafts in discussion
  - considerations for storage power will be significantly different than servers
Summary

- Ask tough “green” questions
  - get estimates of idle power, active power, power supply efficiency & total cost of ownership on systems you are designing
  - consider possible wins of “green” software features
  - be aware of performance and power tradeoffs – know your workloads!

- Get involved with SNIA Green efforts
  - weekly discussions and regular “unplugged” fests
  - next face-to-face meeting is November 2008 in San Diego
  - encourage your Marketing teams to participate in GSI

- Learn about wider green technology and opportunities
  - online resources; workshops by SNIA, EPA, The Green Grid

- Share your experience / knowledge
